Introduction

This HDL guide is part of the ISE® documentation collection. A separate version of this guide is available if you prefer to work with schematics.

This guide contains the following:

- Introduction.
- A list of design elements supported in this architecture, organized by functional categories.
- Descriptions of each available primitive.

About Design Elements

This version of the Libraries Guide describes the valid design elements for 7 series FPGAs and Zynq™-7000 All Programmable SoC devices, and includes examples of instantiation code for each element. Instantiation templates are also supplied in a separate ZIP file, which you can find in your installation directory under ISE/doc/usenglish/isehelp.

Design elements are divided into three main categories:

- **Macros** - These elements are in the UniMacro library in the Xilinx tool, and are used to instantiate primitives that are complex to instantiate by just using the primitives. The synthesis tools will automatically expand the unimacros to their underlying primitives.
- **Primitives** - Xilinx components that are native to the FPGA you are targeting. If you instantiate a primitive in your design, after the translation process (ngdbuild) you will end up with the exact same component in the back end. For example, if you instantiate the Virtex®-5 element known as ISERDES_NODELAY as a user primitive, after you run translate (ngdbuild) you will end up with an ISERDES_NODELAY in the back end as well. If you were using ISERDES in a Virtex-5 device, then this will automatically retarget to an ISERDES_NODELAY for Virtex-5 in the back end. Hence, this concept of a “primitive” differs from other uses of that term in this technology.

CORE Generator maintains software libraries with hundreds of functional design elements (UniMacros and primitives) for different device architectures. New functional elements are assembled with each release of development system software. In addition to a comprehensive Unified Library containing all design elements, this guide is one in a series of architecture-specific libraries.

Design Entry Methods

For each design element in this guide, Xilinx evaluates four options for using the design element, and recommends what we believe is the best solution for you. The four options are:

- **Instantiation** - This component can be instantiated directly into the design. This method is useful if you want to control the exact placement of the individual blocks.
- **Inference** - This component can be inferred by most supported synthesis tools. You should use this method if you want to have complete flexibility and portability of the code to multiple architectures. Inference also gives the tools the ability to optimize for performance, area, or power, as specified by the user to the synthesis tool.
- **Coregen & Wizards** - This component can be used through CORE Generator or other Wizards. You should use this method if you want to build large blocks of any FPGA primitive that cannot be inferred. When using this flow, you will have to re-generate your cores for each architecture that you are targeting.
- **Macro Support** - This component has a UniMacro that can be used. These components are in the UniMacro library in the Xilinx tool, and are used to instantiate primitives that are too complex to instantiate by just using the primitives. The synthesis tools will automatically expand UniMacros to their underlying primitives.

About Unimacros

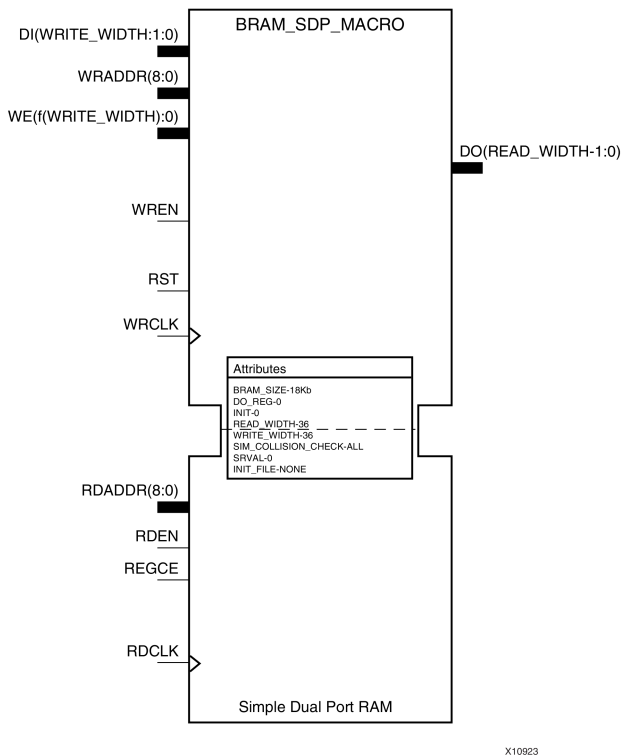

This section describes the unimacros that can be used with 7 series FPGAs and Zynq™-7000 All Programmable SoC devices. The unimacros are organized alphabetically.

The following information is provided for each unimacro, where applicable:

- Name of element
- Brief description
- Schematic symbol
- Logic table (if any)
- Port descriptions
- Design Entry Method
- Available attributes
- Example instantiation code
- For more information

BRAM_SDP_MACRO

Macro: Simple Dual Port RAM

Introduction

7 series FPGA devices contain several block RAM memories that can be configured as general-purpose 36Kb or 18Kb RAM/ROM memories. These block RAM memories offer fast and flexible storage of large amounts of on-chip data. Both read and write operations are fully synchronous to the supplied clock(s) of the component. However, READ and WRITE ports can operate fully independently and asynchronously to each other, accessing the same memory array. Byte-enable write operations are possible, and an optional output register can be used to reduce the clock-to-out times of the RAM.

Note This element must be configured so that read and write ports have the same width.

Port Description

| Name | Direction | Width (Bits) | Function |
|-------------------|-----------|-------------------------|--------------------------------------|
| DO | Output | See Configuration Table | Data output bus addressed by RDADDR. |
| DI | Input | See Configuration Table | Data input bus addressed by WRADDR. |
| WRADDR, RDADDR | Input | See Configuration Table | Write/Read address input buses. |
| WE | Input | See Configuration Table | Byte-Wide Write enable. |
| WREN, RDEN | Input | 1 | Write/Read enable |
| SSR | Input | 1 | Output registers synchronous reset. |

| Name | Direction | Width (Bits) | Function |
|-----------------|-----------|--------------|--|
| REGCE | Input | 1 | Output register clock enable input (valid only when DO_REG=1). |
| WRCLK, RDCLK | Input | 1 | Write/Read clock input. |

Port Configuration

This unimacro is a parameterizable version of the primitive, and can be instantiated only. Use this table to correctly configure the unimacro to meet design needs.

| DATA_WIDTH | BRAM_SIZE | ADDR | WE |
|------------|-----------|------|----|
| 72 - 37 | 36Kb | 9 | 8 |
| 36 - 19 | 36Kb | 10 | 4 |
| | 18Kb | 9 | |
| 18 - 10 | 36Kb | 11 | 2 |
| | 18Kb | 10 | |
| 9 - 5 | 36Kb | 12 | 1 |
| | 18Kb | 11 | |
| 4 - 3 | 36Kb | 13 | 1 |
| | 18Kb | 12 | |
| 2 | 36Kb | 14 | 1 |
| | 18Kb | 13 | |
| 1 | 36Kb | 15 | 1 |
| | 18Kb | 14 | |

Design Entry Method

This unimacro is a parameterizable version of the primitive, and can be instantiated only. Consult the Port Configuration section to correctly configure this element to meet your design needs.

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | Recommended |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-----------|----------------|-----------|--|
| BRAM_SIZE | String | "36Kb", "18Kb" | "18Kb" | Configures RAM as "36Kb" or "18Kb" memory. |
| DEVICE | String | "7SERIES" | "7SERIES" | Target hardware architecture. |

| Attribute | Data Type | Allowed Values | Default | Description |
|----------------------------|-------------|---|------------|--|
| DO_REG | Integer | 0, 1 | 0 | A value of 1 enables to the output registers to the RAM enabling quicker clock-to-out from the RAM at the expense of an added clock cycle of read latency. A value of 0 allows a read in one clock cycle but will have slower clock to out timing. |
| INIT | Hexadecimal | Any 72-Bit Value | All zeros | Specifies the initial value on the output after configuration. |
| READ_WIDTH, WRITE_WIDTH | Integer | 1-72 | 36 | Specifies the size of the DI and DO buses. The following combinations are allowed: <ul style="list-style-type: none"> • READ_WIDTH = WRITE_WIDTH • If asymmetric, READ_WIDTH and WRITE_WIDTH must be in the ratio of 2, or must be values allowed by the unisim (1, 2, 4, 8, 9, 16, 18, 32, 36, 64, 72) |
| INIT_FILE | String | String representing file name and location. | NONE | Name of the file containing initial values. |
| SIM_COLLISION_CHECK | String | "ALL", "WARNING_ONLY", "GENERATE_X_ONLY", "NONE" | "ALL" | Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: <ul style="list-style-type: none"> • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. <p>Note Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see the <i>Synthesis and Simulation Design Guide</i> for more information.</p> |
| SRVAL | Hexadecimal | Any 72-Bit Value | All zeroes | Specifies the output value of on the DO port upon the assertion of the synchronous reset (RST) signal. |

| Attribute | Data Type | Allowed Values | Default | Description |
|----------------------|-------------|-------------------|------------|--|
| INIT_00 to INIT_7F | Hexadecimal | Any 256-Bit Value | All zeroes | Allows specification of the initial contents of the 16Kb or 32Kb data memory array. |
| INITP_00 to INITP_0F | Hexadecimal | Any 256-Bit Value | All zeroes | Allows specification of the initial contents of the 2Kb or 4Kb parity data memory array. |

BRAM_SINGLE_MACRO

Macro: Single Port RAM

Introduction

7 series FPGA devices contain several block RAM memories that can be configured as general-purpose 36Kb or 18Kb RAM/ROM memories. These single-port, block RAM memories offer fast and flexible storage of large amounts of on-chip data. Byte-enable write operations are possible, and an optional output register can be used to reduce the clock-to-out times of the RAM.

Port Description

| Name | Direction | Width | Function |
|-------|-----------|--------------------------------|--|
| DO | Output | See Configuration Table below. | Data output bus addressed by ADDR. |
| DI | Input | See Configuration Table below. | Data input bus addressed by ADDR. |
| ADDR | Input | See Configuration Table below. | Address input bus. |
| WE | Input | See Configuration Table below. | Byte-Wide Write enable. |
| EN | Input | 1 | Write/Read enables. |
| RST | Input | 1 | Output registers synchronous reset. |
| REGCE | Input | 1 | Output register clock enable input (valid only when DO_REG=1). |
| CLK | Input | 1 | Clock input. |

Port Configuration

This unimacro is a parameterizable version of the primitive, and can be instantiated only. Use this table to correctly configure the unimacro to meet design needs.

| WRITE_WIDTH | READ_WIDTH | BRAM_SIZE | ADDR | WE |

BRAM_TDP_MACRO

Macro: True Dual Port RAM

Introduction

7 series FPGA devices contain several block RAM memories that can be configured as general-purpose 36kb or 18kb RAM/ROM memories. These block RAM memories offer fast and flexible storage of large amounts of on-chip data. Both read and write operations are fully synchronous to the supplied clock(s) of the component. However, READ and WRITE ports can operate fully independently and asynchronous to each other, accessing the same memory array. Byte-enable write operations are possible, and an optional output register can be used to reduce the clock-to-out times of the RAM.

Port Description

| Name | Direction | Width | Function |
|------|-----------|--------------------------------|-------------------------------------|
| DOA | Output | See Configuration Table below. | Data output bus addressed by ADDRA. |
| DOB | Output | See Configuration Table below. | Data output bus addressed by ADDRb. |
| DIA | Input | See Configuration Table below. | Data input bus addressed by ADDRA. |
| DIB | Input | See Configuration Table below. | Data input bus addressed by ADDRb. |

| Name | Direction | Width | Function |
|----------------|-----------|--------------------------------|--|
| ADDRA, ADDRb | Input | See Configuration Table below. | Address input buses for Port A, B. |
| WEA, WEB | Input | See Configuration Table below. | Write enable for Port A, B. |
| ENA, ENB | Input | 1 | Write/Read enables for Port A, B. |
| RSTA, RSTB | Input | 1 | Output registers synchronous reset for Port A, B. |
| REGCEA, REGCEB | Input | 1 | Output register clock enable input for Port A, B (valid only when DO_REG=1). |
| CLKA, CLKB | Input | 1 | Write/Read clock input for Port A, B. |

Port Configuration

This unimacro is a parameterizable version of the primitive, and can be instantiated only. Use this table to correctly configure the unimacro to meet design needs.

| WRITE_WIDTH_A/B-DIA/DIB | READ_WIDTH_A/B-DOA/DOB | BRAM_SIZE | ADDRA/B | WEA/B |
|-------------------------|------------------------|-----------|---------|-------|
| 36 - 19 | 36 - 19 | 36Kb | 10 | 4 |
| | 18-10 | | 11 | |
| | 9 - 5 | | 12 | |
| | 4 - 3 | | 13 | |
| | 2 | | 14 | |
| | 1 | | 15 | |
| 18 - 10 | 36 - 19 | 36Kb | 11 | 2 |
| | 18-10 | | 11 | |
| | 9 - 5 | | 12 | |
| | 4 - 3 | | 13 | |
| | 2 | | 14 | |
| | 1 | | 15 | |
| 9 - 5 | 36-19 | 36Kb | 12 | 1 |
| | 18-10 | | 12 | |
| | 9 - 5 | | 12 | |
| | 4 - 3 | | 13 | |
| | 2 | | 14 | |
| | 1 | | 15 | |
| 4 - 3 | 36-19 | 36Kb | 13 | 1 |
| | 18-10 | | 13 | |
| | 9 - 5 | | 13 | |
| | 4 - 3 | | 13 | |
| | 2 | | 14 | |
| | 1 | | 15 | |

| WRITE_WIDTH_A/B-DIA/DIB | READ_WIDTH_A/B-DOA/DOB | BRAM_SIZE | ADDR/A/B | WEA/B |
|-------------------------|------------------------|-----------|----------|-------|

| | 9 - 5 | | 14 | |
| | 4 - 3 | | 14 | |
| | 2 | | 14 | |
| | 1 | | 14 | |

Design Entry Method

This unimacro is a parameterizable version of the primitive, and can be instantiated only. Consult the Port Configuration section to correctly configure this element to meet your design needs.

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | Recommended |

Available Attributes

| Attribute(s) | Data Type | Allowed Values | Default | Description |
|-------------------------|--------------|--|-----------|---|
| BRAM_SIZE | String | "36Kb", "18Kb" | "18Kb" | Configures RAM as "36Kb" or "18Kb" memory. |
| DEVICE | String | "7SERIES" | "7SERIES" | Target hardware architecture. |
| DO_REG | Integer | 0, 1 | 0 | A value of 1 enables to the output registers to the RAM enabling quicker clock-to-out from the RAM at the expense of an added clock cycle of read latency. A value of 0 allows a read in one clock cycle but will have slower clock to out timing. |
| INIT | Hexa-decimal | Any 72-Bit Value | All zeros | Specifies the initial value on the output after configuration. |
| INIT_FILE | String | String representing file name and location. | NONE | Name of file containing initial values. |
| READ_WIDTH, WRITE_WIDTH | Integer | 1 - 72 | 36 | Specifies the size of the DI and DO buses. The following combinations are allowed: <ul style="list-style-type: none"> • READ_WIDTH = WRITE_WIDTH • If asymmetric, READ_WIDTH and WRITE_WIDTH must be in the ratio of 2, or must be values allowed by the unisim (1, 2, 4, 8, 9, 16, 18, 32, 36) |
| SIM_COLLISION_CHECK | String | "ALL", "WARNING_ONLY", "GENERATE_X_ONLY", "NONE" | "ALL" | Allows modification of the simulation behavior if a memory collision occurs. The output is affected as follows: <ul style="list-style-type: none"> • "ALL" - Warning produced and affected outputs/memory location go unknown (X). • "WARNING_ONLY" - Warning produced and affected outputs/memory retain last value. • "GENERATE_X_ONLY" - No warning. However, affected outputs/memory go unknown (X). • "NONE" - No warning and affected outputs/memory retain last value. <p>Note Setting this to a value other than "ALL" can allow problems in the design go unnoticed during simulation. Care should be taken when changing the value of this attribute. Please see</p> |

| Attribute(s) | Data Type | Allowed Values | Default | Description |
|----------------------|--------------|-------------------|------------|--|
| | | | | the <i>Synthesis and Simulation Design Guide</i> for more information. |
| SRVAL_A, SRVAL_B | Hexa-decimal | Any 72-Bit Value | All zeroes | Specifies the output value of on the DO port upon the assertion of the synchronous reset (RST) signal. |
| INIT_00 to INIT_FF | Hexa-decimal | Any 256-Bit Value | All zeroes | Allows specification of the initial contents of the 16Kb or 32Kb data memory array. |
| INITP_00 to INITP_0F | Hexa-decimal | Any 256-Bit Value | All zeroes | Allows specification of the initial contents of the 2Kb or 4Kb parity data memory array. |

VHDL Instantiation Template

Unless they already exist, copy the following four statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;
library UNIMACRO;
use unimacro.Vcomponents.all;
```

```
-- BRAM_TDP_MACRO: True Dual Port RAM
--               7 Series
-- Xilinx HDL Libraries Guide, version 14.7
```

```
-- Note - This Unimacro model assumes the port directions to be "downto".
--        Simulation of this model with "to" in the port directions could lead to erroneous results.
```

```
-----
-- DATA_WIDTH_A/B | BRAM_SIZE | RAM Depth | ADDR/A/B Width | WEA/B Width --
-- -----

Macro: Adder/Multiplier/Accumulator

Introduction

ADDMACC_MACRO simplifies the instantiation of the DSP48 block when used as a pre-add, multiply accumulate function. It features parameterizable input and output widths and latency that ease the integration of DSP48 block into HDL.

Port Description

| Name | Direction | Width | Function |
|------------|-----------|--|--|
| PRODUCT | Output | Variable width, equals the value of the WIDTH_A attribute plus the value of the WIDTH_B attribute. | Primary data output. |
| PREADD1 | Input | Variable, see WIDTH_PREADD attribute. | Preadder data input. |
| PREADD2 | Input | Variable, see WIDTH_PREADD attribute. | Preadder data input |
| MULTIPLIER | Input | Variable, see WIDTH_MULTIPLIER attribute. | Multiplier data input |
| CARRYIN | Input | 1 | Carry input |
| CLK | Input | 1 | Clock |
| CE | Input | 1 | Clock enable |
| LOAD | Input | 1 | Load |
| LOAD_DATA | Input | Variable, see WIDTH_PRODUCT attribute. | In a DSP slice, when LOAD is asserted, loads P with A*B+LOAD_DATA. |
| RST | Input | 1 | Synchronous Reset |

Design Entry Method

This unimacro is a parameterizable version of the primitive, and can be instantiated only.

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | Recommended |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|------------------|-----------|----------------|-----------|--|
| WIDTH_PREADD | Integer | 1 to 24 | 24 | Controls the width of PREADD1 and PREADD2 inputs. |
| WIDTH_MULTIPLIER | Integer | 1 to 18 | 18 | Controls the width of MULTIPLIER input. |
| WIDTH_PRODUCT | Integer | 1 to 48 | 48 | Controls the width of MULTIPLIER output. |
| LATENCY | Integer | 0, 1, 2, 3, 4 | 3 | Number of pipeline registers <ul style="list-style-type: none"> • 1 - MREG == 1 • 2 - AREG == BREG == 1 and MREG == 1 or MREG == 1 and PREG == 1 • 3 - AREG == BREG == 1 and MREG == 1 and PREG == 1 • 4 - AREG == BREG == 2 and MREG == 1 and PREG == 1 |
| DEVICE | String | "7SERIES" | "7SERIES" | Target hardware architecture. |

VHDL Instantiation Template

Unless they already exist, copy the following four statements and paste them before the entity declaration.

```

Library UNISIM;

ADDSUB_MACRO

Macro: Adder/Subtractor

Introduction

ADDSUB_MACRO simplifies the instantiation of the DSP48 block when used as a simple adder/subtractor. It features parameterizable input and output widths and latency that ease the integration of the DSP48 block into HDL.

Port Description

| Name | Direction | Width (Bits) | Function |
|----------|-----------|--------------------------------|--|
| CARRYOUT | Output | 1 | Carry Out |
| RESULT | Output | Variable, see WIDTH attribute. | Data output bus addressed by RDADDR. |
| ADDSUB | Input | 1 | When high, RESULT is an addition. When low, RESULT is a subtraction. |
| A | Input | Variable, see WIDTH attribute. | Data input to add/sub. |
| B | Input | Variable, see WIDTH attribute. | Data input to add/sub |
| CE | Input | 1 | Clock Enable |
| CARRYIN | Input | 1 | Carry In |
| CLK | Input | 1 | Clock |
| RST | Input | 1 | Synchronous Reset |

Design Entry Method

This unimacro is a parameterizable version of the primitive, and can be instantiated only.

| | |
|-----------------------------|-------------|

COUNTER_LOAD_MACRO

Macro: Loadable Counter

Introduction

COUNTER_LOAD_MACRO simplifies the instantiation of the DSP48 block when used as dynamic loading up/down counter. It features parameterizable output width and count by values that ease the integration of the DSP48 block into HDL.

Port Description

| Name | Direction | Width | Function |
|-----------|-----------|-------------------------------------|---|
| Q | Output | Variable, see WIDTH_DATA attribute. | Counter output. |
| CE | Input | 1 | Clock Enable. |
| CLK | Input | 1 | Clock. |
| LOAD | Input | Variable, see WIDTH_DATA attribute. | When asserted, loads the counter from LOAD_DATA (two-clock latency). |
| LOAD_DATA | Input | Variable, see WIDTH_DATA attribute. | In a DSP slice, asserting the LOAD pin will force this data into the P register with a latency of 2 clocks. |
| DIRECTION | Input | 1 | High for Up and Low for Down (two-clock latency) |
| RST | Input | 1 | Synchronous Reset |

Design Entry Method

This unimacro is a parameterizable version of the primitive, and can be instantiated only.

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | Recommended |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|------------|--------------|-------------------|--------------|---|
| DEVICE | String | "7SERIES" | "7SERIES" | Target hardware architecture. |
| COUNT_BY | Hexa-decimal | Any 48 bit value. | 000000000001 | Count by <i>n</i> ; takes precedence over WIDTH_DATA. |
| WIDTH_DATA | Integer | 1-48 | 48 | Specifies counter width. |

VHDL Instantiation Template

Unless they already exist, copy the following four statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;
library UNIMACRO;
use unimacro.Vcomponents.all;

COUNTER_TC_MACRO

Macro: Counter with Terminal Count

Introduction

COUNTER_TC_MACRO simplifies the instantiation of the DSP48 block when used as a terminal count, up/down counter. It features parameterizable output width, terminal count values, count by and count direction in order to ease the integration of DSP48 block into HDL.

Port Description

| Name | Direction | Width (Bits) | Function |
|------|-----------|-------------------------------------|---|
| TC | Output | 1 | Terminal count goes high when TC_VALUE is reached |
| Q | Output | Variable, see WIDTH_DATA attribute. | Counter output |
| CE | Input | 1 | Clock Enable |
| CLK | Input | 1 | Clock |
| RST | Input | 1 | Synchronous Reset |

Design Entry Method

This unimacro is a parameterizable version of the primitive, and can be instantiated only.

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | Recommended |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|---------------|--------------|------------------|--------------|---|
| RESET_UPON_TC | Boolean | True, False | False | Specifies whether to reset the counter upon reaching terminal count |
| DEVICE | String | "7SERIES" | "7SERIES" | Target hardware architecture. |
| DIRECTION | String | "UP", "DOWN" | "UP" | Count up versus count down. |
| COUNT_BY | Hexa-decimal | Any 48 bit value | 000000000001 | Count by <i>n</i> ; takes precedence over WIDTH_DATA |
| TC_VALUE | Hexa-decima | Any 48 bit value | All zeros | Terminal count value. |
| WIDTH_DATA | Integer | 1-48 | 48 | Specifies counter width. |

VHDL Instantiation Template

Unless they already exist, copy the following four statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;
library UNIMACRO;
use unimacro.vcomponents.all;

EQ_COMPARE_MACRO

Macro: Equality Comparator

Introduction

EQ_COMPARE_MACRO simplifies the instantiation of the DSP48 block when used as an equality comparator. It features parameterizable input and output widths, latencies, mask, and input sources that ease the integration of the DSP48 block into HDL.

Port Description

| Name | Direction | Width | Function |
|-----------------|-----------|--|--|
| Q | Output | 1 | Active High pattern detection. Detects match of DATA_IN and the selected DYNAMIC_PATTERN gated by the MASK. Result arrives on the same cycle as P. |
| DATA_IN | Input | Variable width, equals the value of the WIDTH attribute. | Input data to be compared. |
| DYNAMIC_PATTERN | Input | Variable width, equals the value of the WIDTH attribute. | Dynamic data to be compared to DATA_IN. |
| CLK | Input | 1 | Clock. |
| CE | Input | 1 | Clock enable. |
| RST | Input | 1 | Synchronous Reset. |

Design Entry Method

This unimacro is a parameterizable version of the primitive, and can be instantiated only.

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |

MACC_MACRO

Macro: Multiplier/Accumulator

Introduction

MACC_MACRO simplifies the instantiation of the DSP48 block when used in simple signed multiplier/accumulator mode. It features parameterizable input and output widths and latencies that ease the integration of the DSP48 block into HDL.

Port Description

| Name | Direction | Width | Function |
|-----------|-----------|--|--|
| P | Output | Variable width, equals the value of the WIDTH_A attribute plus the value of the WIDTH_B attribute. | Primary data output. |
| A | Input | Variable, see WIDTH_A attribute. | Multiplier data input. |
| B | Input | Variable, see WIDTH_B attribute. | Multiplier data input. |
| CARRYIN | Input | 1 | Carry input. |
| CE | Input | 1 | Clock enable. |
| CLK | Input | 1 | Clock. |
| LOAD | Input | 1 | Load. |
| LOAD_DATA | Input | Variable width, equals the value of the WIDTH_A attribute plus the value of the WIDTH_B attribute. | In a DSP slice, when LOAD is asserted, loads P with A*B+LOAD_DATA. |

| Name | Direction | Width | Function |
|--------|-----------|-------|---|
| RST | Input | 1 | Synchronous Reset. |
| ADDSUB | Input | 1 | High sets accumulator in addition mode; low sets accumulator in subtraction mode. |

Design Entry Method

This unimacro is a parameterizable version of the primitive, and can be instantiated only.

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | Recommended |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-----------|----------------|-----------|---|
| DEVICE | String | "7SERIES" | "7SERIES" | Target hardware architecture. |
| WIDTH_A | Integer | 1 to 25 | 25 | Controls the width of A input. |
| WIDTH_B | Integer | 1 to 18 | 18 | Controls the width of B input. |
| LATENCY | Integer | 0, 1, 2, 3, 4 | 3 | Number of pipeline registers. <ul style="list-style-type: none"> 1 - MREG == 1 2 - AREG == BREG == 1 and MREG == 1 or MREG == 1 and PREG == 1 3 - AREG == BREG == 1 and MREG == 1 and PREG == 1 4 - AREG == BREG == 2 and MREG == 1 and PREG == 1 |

VHDL Instantiation Template

Unless they already exist, copy the following four statements and paste them before the entity declaration.

```

Library UNISIM;

MULT_MACRO

Macro: Multiplier

Introduction

MULT_MACRO simplifies the instantiation of the DSP48 block when used as a simple signed multiplier. It features parameterizable input and output widths and latencies that ease the integration of the DSP48 block into HDL.

Port Description

| Name | Direction | Width | Function |
|------|-----------|--|------------------------|
| P | Output | Variable width, equals the value of the WIDTH_A attribute plus the value of the WIDTH_B attribute. | Primary data output. |
| A | Input | Variable, see WIDTH_A attribute. | Multiplier data input. |
| B | Input | Variable, see WIDTH_B attribute. | Multiplier data input. |
| CE | Input | 1 | Clock Enable. |
| CLK | Input | 1 | Clock. |
| RST | Input | 1 | Synchronous Reset. |

Design Entry Method

This unimacro is a parameterizable version of the primitive, and can be instantiated only.

FIFO_DUALCLOCK_MACRO

Macro: Dual Clock First-In, First-Out (FIFO) RAM Buffer

Introduction

FPGA devices contain several block RAM memories that can be configured as general-purpose 36 Kb or 18 Kb RAM/ROM memories. Dedicated logic in the block RAM enables you to easily implement FIFOs. The FIFO can be configured as an 18 Kb or 36 Kb memory. This unimacro configures the FIFO for using independent read and writes clocks. Data is read from the FIFO on the rising edge of read clock and written to the FIFO on the rising edge of write clock.

Depending on the offset between read and write clock edges, the Empty, Almost Empty, Full and Almost Full flags can deassert one cycle later. Due to the asynchronous nature of the clocks, the simulation model only reflects the deassertion latency cycles listed in the User Guide.

Port Description

| Name | Direction | Width | Function |
|-------------|-----------|--------------------------------|--|
| ALMOSTEMPTY | Output | 1 | Almost all valid entries in FIFO have been read. |
| ALMOSTFULL | Output | 1 | Almost all entries in FIFO memory have been filled. |
| DO | Output | See Configuration Table below. | Data output bus addressed by ADDR. |
| EMPTY | Output | 1 | FIFO is empty. |
| FULL | Output | 1 | All entries in FIFO memory are filled. |
| RDCOUNT | Output | See Configuration Table below. | FIFO data read pointer. |
| RDERR | Output | 1 | When the FIFO is empty, any additional read operation generates an error flag. |

| Name | Direction | Width | Function |
|---------|-----------|--------------------------------|--|
| WRCOUNT | Output | See Configuration Table below. | FIFO data write pointer. |
| WRERR | Output | 1 | When the FIFO is full, any additional write operation generates an error flag. |
| DI | Input | See Configuration Table below. | Data input bus addressed by ADDR. |
| RDCLK | Input | 1 | Clock for Read domain operation. |
| RDEN | Input | 1 | Read Enable. |
| RST | Input | 1 | Asynchronous reset. |
| WRCLK | Input | 1 | Clock for Write domain operation. |
| WREN | Input | 1 | Write Enable. |

Port Configuration

This unimacro is a parameterizable version of the primitive, and can be instantiated only. Use this table to correctly configure the unimacro to meet design needs.

| DATA_WIDTH | FIFO_SIZE | WRCOUNT | RDCOUNT |
|------------|-----------|---------|---------|
| 72 - 37 | 36 Kb | 9 | 9 |
| 36 - 19 | 36 Kb | 10 | 10 |
| | 18 Kb | 9 | 9 |
| 18 - 10 | 36 Kb | 11 | 11 |
| | 18 Kb | 10 | 10 |
| 9-5 | 36 Kb | 12 | 12 |
| | 18 Kb | 11 | 11 |
| 1-4 | 36 Kb | 13 | 13 |
| | 18 Kb | 12 | 12 |

Design Entry Method

This unimacro is a parameterizable version of the primitive, and can be instantiated only. Consult the Port Configuration section to correctly configure this element to meet your design needs.

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | Recommended |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-------------------------|-------------|----------------|-----------|---|
| ALMOST_EMPTY_OFFSET | Hexadecimal | 13-bit value | 13'h0080 | Setting determines the difference between EMPTY and ALMOSTEMPTY conditions. Must be set using hexadecimal notation. |
| ALMOST_FULL_OFFSET | Hexadecimal | 13-bit value | 13'h0080 | Setting determines the difference between FULL and ALMOSTFULL conditions. Must be set using hexadecimal notation. |
| DATA_WIDTH | Integer | 1 - 72 | 4 | Width of DI/DO bus. |
| DEVICE | String | "7SERIES" | "7SERIES" | Target hardware architecture. |
| FIFO_SIZE | String | "18Kb", "36Kb" | "18Kb" | Configures the FIFO as 18 Kb or 36 Kb memory. |
| FIRST_WORD_FALL_THROUGH | Boolean | FALSE, TRUE | FALSE | If TRUE, the first word written into the empty FIFO appears at the FIFO output without RDEN asserted. |

VHDL Instantiation Template

Unless they already exist, copy the following four statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;
library UNIMACRO;
use unimacro.vcomponents.all;
```

```
-- FIFO_DUALCLOCK_MACRO: Dual-Clock First-In, First-Out (FIFO) RAM Buffer
-- 7 Series
-- Xilinx HDL Libraries Guide, version 14.7
```

```
-- Note - This Unimacro model assumes the port directions to be "downto".
-- Simulation of this model with "to" in the port directions could lead to erroneous results.
```

```

FIFO_SYNC_MACRO

Macro: Synchronous First-In, First-Out (FIFO) RAM Buffer

Introduction

FPGA devices contain several block RAM memories that can be configured as general-purpose 36Kb or 18Kb RAM/ROM memories. Dedicated logic in the block RAM enables you to easily implement FIFOs. The FIFO can be configured as an 18 Kb or 36 Kb memory. This unimacro configures the FIFO such that it uses one clock for reading as well as writing.

Port Description

| Name | Direction | Width | Function |
|-------------|-----------|--------------------------------|--|
| ALMOSTEMPTY | Output | 1 | Almost all valid entries in FIFO have been read. |
| ALMOSTFULL | Output | 1 | Almost all entries in FIFO memory have been filled. |
| DO | Output | See Configuration Table. | Data output bus addressed by ADDR. |
| EMPTY | Output | 1 | FIFO is empty. |
| FULL | Output | 1 | All entries in FIFO memory are filled. |
| RDCOUNT | Output | See Configuration Table below. | FIFO data read pointer. |
| RDERR | Output | 1 | When the FIFO is empty, any additional read operation generates an error flag. |
| WRCOUNT | Output | See Configuration Table. | FIFO data write pointer. |
| WRERR | Output | 1 | When the FIFO is full, any additional write operation generates an error flag. |
| CLK | Input | 1 | Clock for Read/Write domain operation. |

| Name | Direction | Width | Function |
|------|-----------|--------------------------|-----------------------------------|
| DI | Input | See Configuration Table. | Data input bus addressed by ADDR. |
| RDEN | Input | 1 | Read Enable |
| RST | Input | 1 | Asynchronous reset. |
| WREN | Input | 1 | Write Enable |

Port Configuration

This unimacro is a parameterizable version of the primitive, and can be instantiated only. Use this table to correctly configure the unimacro to meet design needs.

| DATA_WIDTH | FIFO_SIZE | WRCOUNT | RDCOUNT |
|------------|-----------|---------|---------|
| 72 - 37 | 36Kb | 9 | 9 |
| 36 - 19 | 36Kb | 10 | 10 |
| | 18Kb | 9 | 9 |
| 18 - 10 | 36Kb | 11 | 11 |
| | 18Kb | 10 | 10 |
| 9-5 | 36Kb | 12 | 12 |
| | 18Kb | 11 | 11 |
| 1-4 | 36Kb | 13 | 13 |
| | 18Kb | 12 | 12 |

Design Entry Method

This unimacro is a parameterizable version of the primitive, and can be instantiated only. Consult the Port Configuration section to correctly configure this element to meet your design needs.

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | Recommended |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|---------------------|-------------|----------------|-----------|---|
| ALMOST_EMPTY_OFFSET | Hexadecimal | 13 bit HEX | All zeros | Setting determines the difference between EMPTY and ALMOSTEMPTY conditions. Must be set using hexadecimal notation. |
| ALMOST_FULL_OFFSET | Hexadecimal | 13 bit HEX | All zeros | Setting determines the difference between FULL and ALMOSTFULL conditions. Must be set using hexadecimal notation. |
| DATA_WIDTH | Integer | 1 - 72 | 4 | Width of DI/DO bus. |
| DEVICE | String | "7SERIES" | "7SERIES" | Target hardware architecture. |
| DO_REG | Binary | 0,1 | 1 | DO_REG must be set to 0 for flags and data to follow a standard synchronous FIFO operation. |

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-----------|-------------------|---------|---|
| | | | | When DO_REG is set to 1, effectively a pipeline register is added to the output of the synchronous FIFO. Data then has a one clock cycle latency. However, the clock-to-out timing is improved. |
| FIFO_SIZE | String | "18Kb", "36Kb" | "18Kb" | Configures FIFO as "18Kb" or "36Kb" memory. |

VHDL Instantiation Template

Unless they already exist, copy the following four statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;
library UNIMACRO;
use unimacro.Vcomponents.all;
```

```
-- FIFO_SYNC_MACRO: Synchronous First-In, First-Out (FIFO) RAM Buffer
--                               7 Series
-- Xilinx HDL Libraries Guide, version 14.7
```

```
-- Note - This Unimacro model assumes the port directions to be "downto".
--        Simulation of this model with "to" in the port directions could lead to erroneous results.
```

```
-----
-- DATA_WIDTH | FIFO_SIZE | FIFO Depth | RDCOUNT/WRCOUNT Width --
-- -----
-- 37-72       | "36Kb"  | 512       | 9-bit                  --
-- 19-36       | "36Kb"  | 1024      | 10-bit                 --
-- 19-36       | "18Kb"  | 512       | 9-bit                  --
-- 10-18       | "36Kb"  | 2048      | 11-bit                 --
-- 10-18       | "18Kb"  | 1024      | 10-bit                 --
-- 5-9         | "36Kb"  | 4096      | 12-bit                 --

Functional Categories

This section categorizes, by function, the circuit design elements described in detail later in this guide. The elements (*primitives* and *macros*) are listed in alphanumeric order under each functional category.

| | | |
|----------------------|-------------------------|----------------------|
| Advanced | Config/BSCAN Components | Registers/Latches |
| Arithmetic Functions | I/O Components | Slice/CLB Primitives |
| Clock Components | RAM/ROM | |

Advanced

| Design Element | Description |
|-------------------------------|--|
| GTPE2_CHANNEL | Primitive: Gigabit Transceiver for 7 series Devices |
| GTPE2_COMMON | Primitive: Gigabit Transceiver for 7 series Devices |
| GTHE2_CHANNEL | Primitive: Gigabit Transceiver for 7 Series Devices |
| GTHE2_COMMON | Primitive: Gigabit Transceiver for 7 Series Devices |
| GTXE2_CHANNEL | Primitive: Gigabit Transceiver for 7 series Devices |
| GTXE2_COMMON | Primitive: Gigabit Transceiver for 7 series Devices |
| PCIE_2_1 | Primitive: PCI Express Version 2.1 Model |
| PCIE_3_0 | Primitive: PCI Express Version 3.0 Model |
| XADC | Primitive: Dual 12-Bit 1MSPS Analog-to-Digital Converter |

Arithmetic Functions

| Design Element | Description |
|-------------------------|---|
| DSP48E1 | Primitive: 48-bit Multi-Functional Arithmetic Block |

Clock Components

| Design Element | Description |
|----------------|--|
| BUFG | Primitive: Global Clock Simple Buffer |
| BUFGCE | Primitive: Global Clock Buffer with Clock Enable |
| BUFGCE_1 | Primitive: Global Clock Buffer with Clock Enable and Output State 1 |
| BUFGCTRL | Primitive: Global Clock Control Buffer |
| BUFGMUX | Primitive: Global Clock Mux Buffer |
| BUFGMUX_1 | Primitive: Global Clock Mux Buffer with Output State 1 |
| BUFGMUX_CTRL | Primitive: 2-to-1 Global Clock MUX Buffer |
| BUFH | Primitive: HROW Clock Buffer for a Single Clocking Region |
| BUFHCE | Primitive: HROW Clock Buffer for a Single Clocking Region with Clock Enable |
| BUFIO | Primitive: Local Clock Buffer for I/O |
| BUFMR | Primitive: Multi-Region Clock Buffer |
| BUFMRCE | Primitive: Multi-Region Clock Buffer with Clock Enable |
| BUFR | Primitive: Regional Clock Buffer for I/O and Logic Resources within a Clock Region |
| MMCME2_ADV | Primitive: Advanced Mixed Mode Clock Manager |
| MMCME2_BASE | Primitive: Base Mixed Mode Clock Manager |
| PLLE2_ADV | Primitive: Advanced Phase Locked Loop (PLL) |
| PLLE2_BASE | Primitive: Base Phase Locked Loop (PLL) |

Config/BSCAN Components

| Design Element | Description |
|----------------|---|
| BSCANE2 | Primitive: Boundary-Scan User Instruction |
| CAPTUREE2 | Primitive: Register Capture |
| DNA_PORT | Primitive: Device DNA Access Port |
| EFUSE_USR | Primitive: 32-bit non-volatile design ID |
| FRAME_ECCE2 | Primitive: Configuration Frame Error Correction |
| ICAPE2 | Primitive: Internal Configuration Access Port |
| STARTUPE2 | Primitive: STARTUP Block |
| USR_ACCESSE2 | Primitive: Configuration Data Access |

I/O Components

| Design Element | Description |
|------------------|---|
| DCIRESET | Primitive: Digitally Controlled Impedance Reset Component |
| IBUF | Primitive: Input Buffer |
| IBUF_IBUFDISABLE | Primitive: Single-ended Input Buffer with Input Disable |

| Design Element | Description |
|--------------------------------|--|
| IBUF_INTERMDISABLE | Primitive: Single-ended Input Buffer with Input Termination Disable and Input Disable |
| IBUFDS | Primitive: Differential Signaling Input Buffer |
| IBUFDS_DIFF_OUT | Primitive: Differential Signaling Input Buffer With Differential Output |
| IBUFDS_DIFF_OUT_IBUFDISABLE | Primitive: Input Differential Buffer with Input Disable and Differential Output |
| IBUFDS_DIFF_OUT_INTERMDISABLE | Primitive: Input Differential Buffer with Input Termination Disable, Input Disable, and Differential Output |
| IBUFDS_GTE2 | Primitive: Gigabit Transceiver Buffer |
| IBUFDS_IBUFDISABLE | Primitive: Input Differential Buffer with Input Path Disable |
| IBUFDS_INTERMDISABLE | Primitive: Input Differential Buffer with Input Termination Disable and Input Disable |
| IBUFG | Primitive: Dedicated Input Clock Buffer |
| IBUFGDS | Primitive: Differential Signaling Dedicated Input Clock Buffer |
| IBUFGDS_DIFF_OUT | Primitive: Differential Signaling Dedicated Input Clock Buffer with Differential Output |
| IDELAYCTRL | Primitive: IDELAYE2/ODELAYE2 Tap Delay Value Control |
| IDELAYE2 | Primitive: Input Fixed or Variable Delay Element |
| IN_FIFO | Primitive: Input First-In, First-Out (FIFO) |
| IOBUF | Primitive: Bi-Directional Buffer |
| IOBUF_DCIE | Primitive: Bi-Directional Single-ended Buffer with DCI and Input Disable. |
| IOBUF_INTERMDISABLE | Primitive: Bi-Directional Single-ended Buffer with Input Termination Disable and Input Path Disable |
| IOBUFDS | Primitive: 3-State Differential Signaling I/O Buffer with Active Low Output Enable |
| IOBUFDS_DCIE | Primitive: Bi-Directional Differential Buffer with DCI Enable/Disable and Input Disable |
| IOBUFDS_DIFF_OUT | Primitive: Differential Bi-directional Buffer with Differential Output |
| IOBUFDS_DIFF_OUT_DCIE | Primitive: Bi-Directional Differential Buffer with DCI Disable, Input Disable, and Differential Output |
| IOBUFDS_DIFF_OUT_INTERMDISABLE | Primitive: Bi-Directional Differential Buffer with Input Termination Disable, Input Disable, and Differential Output |
| IOBUFDS_INTERMDISABLE | Primitive: Bi-Directional Differential Buffer with Input Termination Disable and Input Disable |
| ISERDESE2 | Primitive: Input SERial/DESerializer with Bit-slip |
| KEEPER | Primitive: KEEPER Symbol |
| OBUF | Primitive: Output Buffer |
| OBUFDS | Primitive: Differential Signaling Output Buffer |
| OBUFT | Primitive: 3-State Output Buffer with Active Low Output Enable |

| Design Element | Description |
|--------------------------------|--|
| OBUFTDS | Primitive: 3-State Output Buffer with Differential Signaling, Active-Low Output Enable |
| ODELAYE2 | Primitive: Output Fixed or Variable Delay Element |
| OSERDESE2 | Primitive: Output SERIAL/DESerializer with bit-slip |
| OUT_FIFO | Primitive: Output First-In, First-Out (FIFO) Buffer |
| PHASER_IN | Primitive: MIG Data Alignment and Capture Component |
| PHASER_IN_PHY | Primitive: MIG Data Alignment and Capture Component |
| PHASER_OUT | Primitive: MIG Data Alignment and Capture Component |
| PHASER_OUT_PHY | Primitive: MIG Data Alignment and Capture Component |
| PHASER_REF | Primitive: MIG Data Alignment and Capture Component |
| PHY_CONTROL | Primitive: MIG Data Alignment and Capture Component |
| PULLDOWN | Primitive: Resistor to GND for Input Pads, Open-Drain, and 3-State Outputs |
| PULLUP | Primitive: Resistor to VCC for Input PADS, Open-Drain, and 3-State Outputs |

RAM/ROM

| Design Element | Description |
|----------------------------|---|
| FIFO18E1 | Primitive: 18Kb FIFO (First-In-First-Out) Block RAM Memory |
| FIFO36E1 | Primitive: 36Kb FIFO (First-In-First-Out) Block RAM Memory |
| RAM128X1D | Primitive: 128-Deep by 1-Wide Dual Port Random Access Memory (Select RAM) |
| RAM128X1S | Primitive: 128-Deep by 1-Wide Random Access Memory (Select RAM) |
| RAM256X1S | Primitive: 256-Deep by 1-Wide Random Access Memory (Select RAM) |
| RAM32M | Primitive: 32-Deep by 8-bit Wide Multi Port Random Access Memory (Select RAM) |
| RAM32X1D | Primitive: 32-Deep by 1-Wide Static Dual Port Synchronous RAM |
| RAM32X1S | Primitive: 32-Deep by 1-Wide Static Synchronous RAM |
| RAM32X1S_1 | Primitive: 32-Deep by 1-Wide Static Synchronous RAM with Negative-Edge Clock |
| RAM32X2S | Primitive: 32-Deep by 2-Wide Static Synchronous RAM |
| RAM64M | Primitive: 64-Deep by 4-bit Wide Multi Port Random Access Memory (Select RAM) |
| RAM64X1D | Primitive: 64-Deep by 1-Wide Dual Port Static Synchronous RAM |
| RAM64X1S | Primitive: 64-Deep by 1-Wide Static Synchronous RAM |
| RAM64X1S_1 | Primitive: 64-Deep by 1-Wide Static Synchronous RAM with Negative-Edge Clock |

| Design Element | Description |
|--------------------------|---|
| RAMB18E1 | Primitive: 18K-bit Configurable Synchronous Block RAM |
| RAMB36E1 | Primitive: 36K-bit Configurable Synchronous Block RAM |
| ROM128X1 | Primitive: 128-Deep by 1-Wide ROM |
| ROM256X1 | Primitive: 256-Deep by 1-Wide ROM |
| ROM32X1 | Primitive: 32-Deep by 1-Wide ROM |
| ROM64X1 | Primitive: 64-Deep by 1-Wide ROM |

Registers/Latches

| Design Element | Description |
|---------------------------|--|
| FDCE | Primitive: D Flip-Flop with Clock Enable and Asynchronous Clear |
| FDPE | Primitive: D Flip-Flop with Clock Enable and Asynchronous Preset |
| FDRE | Primitive: D Flip-Flop with Clock Enable and Synchronous Reset |
| FDSE | Primitive: D Flip-Flop with Clock Enable and Synchronous Set |
| IDDR | Primitive: Input Dual Data-Rate Register |
| IDDR_2CLK | Primitive: Input Dual Data-Rate Register with Dual Clock Inputs |
| LDCE | Primitive: Transparent Data Latch with Asynchronous Clear and Gate Enable |
| LDPE | Primitive: Transparent Data Latch with Asynchronous Preset and Gate Enable |
| ODDR | Primitive: Dedicated Dual Data Rate (DDR) Output Register |

Slice/CLB Primitives

| Design Element | Description |
|-------------------------|---|
| CARRY4 | Primitive: Fast Carry Logic with Look Ahead |
| CFGLUT5 | Primitive: 5-input Dynamically Reconfigurable Look-Up Table (LUT) |
| LUT1 | Primitive: 1-Bit Look-Up Table with General Output |
| LUT1_D | Primitive: 1-Bit Look-Up Table with Dual Output |
| LUT1_L | Primitive: 1-Bit Look-Up Table with Local Output |
| LUT2 | Primitive: 2-Bit Look-Up Table with General Output |
| LUT2_D | Primitive: 2-Bit Look-Up Table with Dual Output |
| LUT2_L | Primitive: 2-Bit Look-Up Table with Local Output |
| LUT3 | Primitive: 3-Bit Look-Up Table with General Output |
| LUT3_D | Primitive: 3-Bit Look-Up Table with Dual Output |
| LUT3_L | Primitive: 3-Bit Look-Up Table with Local Output |

| Design Element | Description |
|-------------------------|---|
| LUT4 | Primitive: 4-Bit Look-Up-Table with General Output |
| LUT4_D | Primitive: 4-Bit Look-Up Table with Dual Output |
| LUT4_L | Primitive: 4-Bit Look-Up Table with Local Output |
| LUT5 | Primitive: 5-Input Lookup Table with General Output |
| LUT5_D | Primitive: 5-Input Lookup Table with General and Local Outputs |
| LUT5_L | Primitive: 5-Input Lookup Table with Local Output |
| LUT6 | Primitive: 6-Input Lookup Table with General Output |
| LUT6_2 | Primitive: Six-input, 2-output, Look-Up Table |
| LUT6_D | Primitive: 6-Input Lookup Table with General and Local Outputs |
| LUT6_L | Primitive: 6-Input Lookup Table with Local Output |
| MUXF7 | Primitive: 2-to-1 Look-Up Table Multiplexer with General Output |
| MUXF7_D | Primitive: 2-to-1 Look-Up Table Multiplexer with Dual Output |
| MUXF7_L | Primitive: 2-to-1 look-up table Multiplexer with Local Output |
| MUXF8 | Primitive: 2-to-1 Look-Up Table Multiplexer with General Output |
| MUXF8_D | Primitive: 2-to-1 Look-Up Table Multiplexer with Dual Output |
| MUXF8_L | Primitive: 2-to-1 Look-Up Table Multiplexer with Local Output |
| SRL16E | Primitive: 16-Bit Shift Register Look-Up Table (LUT) with Clock Enable |
| SRLC32E | Primitive: 32 Clock Cycle, Variable Length Shift Register Look-Up Table (LUT) with Clock Enable |

About Design Elements

This section describes the design elements that can be used with 7 series FPGAs and Zynq™-7000 All Programmable SoC devices. The design elements are organized alphabetically.

The following information is provided for each design element, where applicable:

- Name of element
- Brief description
- Schematic symbol (if any)
- Logic table (if any)
- Port descriptions
- Design Entry Method
- Available attributes (if any)
- Example instantiation code
- For more information

BSCANE2

Primitive: Boundary-Scan User Instruction

Introduction

This design element allows access to and from internal logic by the JTAG Boundary Scan logic controller. This allows for communication between the internal running design and the dedicated JTAG pins of the FPGA. Each instance of this design element will handle one JTAG USER instruction (USER1 through USER4) as set with the JTAG_CHAIN attribute.

To handle all four USER instructions, instantiate four of these elements and set the JTAG_CHAIN attribute appropriately.

For specific information on boundary scan for an architecture, see the Configuration User Guide for the specific device.

Port Descriptions

| Port | Type | Width | Function |
|---------|--------|-------|--|
| CAPTURE | Output | 1 | CAPTURE output from TAP controller. |
| DRCK | Output | 1 | Gated TCK output. When SEL is asserted, DRCK toggles when CAPTURE or SHIFT are asserted. |
| RESET | Output | 1 | Reset output for TAP controller. |
| RUNTEST | Output | 1 | Output asserted when TAP controller is in Run Test/Idle state. |
| SEL | Output | 1 | USER instruction active output. |
| SHIFT | Output | 1 | SHIFT output from TAP controller. |
| TCK | Output | 1 | Test Clock output. Fabric connection to TAP Clock pin. |
| TDI | Output | 1 | Test Data Input (TDI) output from TAP controller. |
| TDO | Input | 1 | Test Data Output (TDO) input for USER function. |
| TMS | Output | 1 | Test Mode Select output. Fabric connection to TAP. |
| UPDATE | Output | 1 | UPDATE output from TAP controller |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|------------|---------|----------------|---------|-------------------------|
| JTAG_CHAIN | DECIMAL | 1, 2, 3, 4 | 1 | Value for USER command. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- BSCANE2: Boundary-Scan User Instruction
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

BSCANE2_inst : BSCANE2
generic map (
  JTAG_CHAIN => 1 -- Value for USER command.
)
port map (
  CAPTURE => CAPTURE, -- 1-bit output: CAPTURE output from TAP controller.
  DRCK => DRCK,       -- 1-bit output: Gated TCK output. When SEL is asserted, DRCK toggles when CAPTURE or
                    -- SHIFT are asserted.

  RESET => RESET,    -- 1-bit output: Reset output for TAP controller.
  RUNTEST => RUNTEST, -- 1-bit output: Output asserted when TAP controller is in Run Test/Idle state.
  SEL => SEL,        -- 1-bit output: USER instruction active output.
  SHIFT => SHIFT,    -- 1-bit output: SHIFT output from TAP controller.
  TCK => TCK,       -- 1-bit output: Test Clock output. Fabric connection to TAP Clock pin.
  TDI => TDI,       -- 1-bit output: Test Data Input (TDI) output from TAP controller.
  TMS => TMS,       -- 1-bit output: Test Mode Select output. Fabric connection to TAP.
  UPDATE => UPDATE, -- 1-bit output: UPDATE output from TAP controller
  TDO => TDO        -- 1-bit input: Test Data Output (TDO) input for USER function.
);

-- End of BSCANE2_inst instantiation
```

Verilog Instantiation Template

BUFG

Primitive: Global Clock Simple Buffer

Introduction

This design element is a high-fanout buffer that connects signals to the global routing resources for low skew distribution of the signal. BUF8s are typically used on clock nets as well other high fanout nets like sets/resets and clock enables.

Port Descriptions

| Port | Type | Width | Function |
|------|--------|-------|--------------|
| I | Input | 1 | Clock input |
| O | Output | 1 | Clock output |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- BUF8: Global Clock Simple Buffer
--      7 Series
-- Xilinx HDL Libraries Guide, version 14.7

BUFG_inst : BUF8
port map (
  O => O, -- 1-bit output: Clock output
  I => I  -- 1-bit input: Clock input
);

-- End of BUF8_inst instantiation
```

Verilog Instantiation Template

```
// BUFG: Global Clock Simple Buffer
//      7 Series
// Xilinx HDL Libraries Guide, version 14.7

BUFG BUFG_inst (
    .O(O), // 1-bit output: Clock output
    .I(I) // 1-bit input: Clock input
);

// End of BUFG_inst instantiation
```

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

BUFGCE

Primitive: Global Clock Buffer with Clock Enable

Introduction

This design element is a global clock buffer with a single gated input. Its O output is "0" when clock enable (CE) is Low (inactive). When clock enable (CE) is High, the I input is transferred to the O output.

Logic Table

| Inputs | | Outputs |
|--------|----|---------|
| I | CE | O |
| X | 0 | 0 |
| I | 1 | I |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- BUFGCE: Global Clock Buffer with Clock Enable
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

BUFGCE_inst : BUFGCE
port map (
  O => O, -- 1-bit output: Clock output
  CE => CE, -- 1-bit input: Clock enable input for IO
  I => I -- 1-bit input: Primary clock
);

-- End of BUFGCE_inst instantiation
```

Verilog Instantiation Template

```
// BUFGCE: Global Clock Buffer with Clock Enable
//      7 Series
// Xilinx HDL Libraries Guide, version 14.7

BUFGCE BUFGCE_inst (
    .O(O), // 1-bit output: Clock output
    .CE(CE), // 1-bit input: Clock enable input for IO
    .I(I) // 1-bit input: Primary clock
);

// End of BUFGCE_inst instantiation
```

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

BUFGCE_1

Primitive: Global Clock Buffer with Clock Enable and Output State 1

Introduction

This design element is a global clock buffer with a single gated input. Its O output is "1" when clock enable (CE) is Low (inactive). When clock enable (CE) is High, the I input is transferred to the O output.

Logic Table

| Inputs | | Outputs |
|--------|----|---------|
| I | CE | O |
| X | 0 | 1 |
| I | 1 | I |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|---------------------------------|
| CE | Input | 1 | Clock buffer active high enable |
| I | Input | 1 | Clock input |
| O | Output | 1 | Clock output |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- BUFGCE_1: Global Clock Buffer with Clock Enable and Output State 1
--           7 Series
-- Xilinx HDL Libraries Guide, version 14.7

BUFGCE_1_inst : BUFGCE_1
port map (
    O => O,    -- 1-bit output: Clock output
    CE => CE,  -- 1-bit input: Clock enable input for IO
    I => I     -- 1-bit input: Primary clock
);

-- End of BUFGCE_1_inst instantiation
```

Verilog Instantiation Template

```
// BUFGCE_1: Global Clock Buffer with Clock Enable and Output State 1
//           7 Series
// Xilinx HDL Libraries Guide, version 14.7

BUFGCE_1 BUFGCE_1_inst (
    .O(O),    // 1-bit output: Clock output
    .CE(CE),  // 1-bit input: Clock enable input for IO
    .I(I)     // 1-bit input: Primary clock
);

// End of BUFGCE_1_inst instantiation
```

BUFGCTRL

Primitive: Global Clock Control Buffer

Introduction

BUFGCTRL primitive is a 7 series global clock buffer that is designed as a synchronous/asynchronous "glitch free" 2:1 multiplexer with two clock inputs. Unlike global clock buffers that are found in previous generations of FPGAs, these clock buffers are designed with more control pins to provide a wider range of functionality and more robust input switching. BUFGCTRL is not limited to clocking applications.

Port Descriptions

| Port | Type | Width | Function |
|---------|--------|-------|--|
| CE0 | Input | 1 | Clock enable input for the I0 clock input. A setup/hold time must be guaranteed when you are using the CE0 pin to enable this input. Failure to meet this requirement could result in a clock glitch. |
| CE1 | Input | 1 | Clock enable input for the I1 clock input. A setup/hold time must be guaranteed when you are using the CE1 pin to enable this input. Failure to meet this requirement could result in a clock glitch. |
| IGNORE0 | Input | 1 | Clock ignore input for I0 input. Asserting the IGNORE pin will bypass the BUFGCTRL from detecting the conditions for switching between two clock inputs. In other words, asserting IGNORE causes the MUX to switch the inputs at the instant the select pin changes. IGNORE0 causes the output to switch away from the I0 input immediately when the select pin changes, while IGNORE1 causes the output to switch away from the I1 input immediately when the select pin changes. |
| IGNORE1 | Input | 1 | Clock ignore input for I1 input. Asserting the IGNORE pin will bypass the BUFGCTRL from detecting the conditions for switching between two clock inputs. In other words, asserting IGNORE causes the MUX to switch the inputs at the instant the select pin changes. IGNORE0 causes the output to switch away from the I0 input immediately when the select pin changes, while IGNORE1 causes the output to switch away from the I1 input immediately when the select pin changes. |
| I0 | Input | 1 | Primary clock input into the BUFGCTRL enabled by the CE0 input and selected by the S0 input. |
| I1 | Input | 1 | Secondary clock input into the BUFGCTRL enabled by the CE1 input and selected by the S1 input. |
| O | Output | 1 | Clock output |
| S0 | Input | 1 | Clock select input for I0. The S pins represent the clock select pin for each clock input. When using the S pin as input select, there is |

| Port | Type | Width | Function |
|------|-------|-------|--|
| | | | a setup/hold time requirement. Unlike CE pins, failure to meet this requirement will not result in a clock glitch. However, it can cause the output clock to appear one clock cycle later. |
| S1 | Input | 1 | Clock select input for I1. The S pins represent the clock select pin for each clock input. When using the S pin as input select, there is a setup/hold time requirement. Unlike CE pins, failure to meet this requirement will not result in a clock glitch. However, it can cause the output clock to appear one clock cycle later. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|--------------|---------|----------------|---------|---|
| INIT_OUT | DECIMAL | 0, 1 | 0 | Initializes the BUFGCTRL output to the specified value after configuration. |
| PRESELECT_I0 | BOOLEAN | FALSE, TRUE | FALSE | If TRUE, BUFGCTRL output uses I0 input after configuration. |
| PRESELECT_I1 | BOOLEAN | FALSE, TRUE | FALSE | If TRUE, BUFGCTRL output uses I1 input after configuration. |

Note Both PRESELECT attributes might not be TRUE at the same time.

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```

Library UNISIM;
use UNISIM.vcomponents.all;

-- BUFGCTRL: Global Clock Control Buffer
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

BUFGCTRL_inst : BUFGCTRL
generic map (
  INIT_OUT => 0,           -- Initial value of BUFGCTRL output ($VALUES;)
  PRESELECT_I0 => FALSE,  -- BUFGCTRL output uses I0 input ($VALUES;)
  PRESELECT_I1 => FALSE   -- BUFGCTRL output uses I1 input ($VALUES;)
)
port map (
  O => O,                 -- 1-bit output: Clock output
  CE0 => CE0,             -- 1-bit input: Clock enable input for I0
  CE1 => CE1,             -- 1-bit input: Clock enable input for I1
  I0 => I0,               -- 1-bit input: Primary clock
  I1 => I1,               -- 1-bit input: Secondary clock
  IGNORE0 => IGNORE0,    -- 1-bit input: Clock ignore input for I0
  IGNORE1 => IGNORE1,    -- 1-bit input: Clock ignore input for I1
  S0 => S0,               -- 1-bit input: Clock select for I0
  S1 => S1                -- 1-bit input: Clock select for I1
);

```

```
-- End of BUFCTRL_inst instantiation
```

Verilog Instantiation Template

```
// BUFCTRL: Global Clock Control Buffer

BUFGMUX

Primitive: Global Clock Mux Buffer

Introduction

This design element is a global clock buffer, based off of the BUFGCTRL, that can select between two input clocks: I0 and I1. When the select input (S) is Low, the signal on I0 is selected for output (O). When the select input (S) is High, the signal on I1 is selected for output. BUFGMUX and BUFGMUX_1 are distinguished by the state the output assumes when that output switches between clocks in response to a change in its select input. BUFGMUX assumes output state 0 and BUFGMUX_1 assumes output state 1.

Logic Table

| Inputs | | | Outputs |
|--------|----|---|---------|
| I0 | I1 | S | O |
| I0 | X | 0 | I0 |
| X | I1 | 1 | I1 |
| X | X | ↑ | 0 |
| X | X | ↓ | 0 |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| I0 | Input | 1 | Clock buffer input. This input is reflected on the output O when the S input is zero. |
| I1 | Input | 1 | Clock buffer input. This input is reflected on the output O when the S input is one. |
| O | Output | 1 | Clock buffer output. |
| S | Input | 1 | Clock buffer select input. When low, selects I0 input and when high, the I1 input is selected. |

Design Entry Method

BUFGMUX_1

Primitive: Global Clock Mux Buffer with Output State 1

Introduction

This design element is a global clock buffer, based off of the BUFGCTRL, that can select between two input clocks: I0 and I1. When the select input (S) is Low, the signal on I0 is selected for output (O). When the select input (S) is High, the signal on I1 is selected for output. BUFGMUX and BUFGMUX_1 are distinguished by the state the output assumes when that output switches between clocks in response to a change in its select input. BUFGMUX assumes output state0 and BUFGMUX_1 assumes output state 1.

Logic Table

| Inputs | | | Outputs |
|--------|----|---|---------|
| I0 | I1 | S | O |
| I0 | X | 0 | I0 |
| X | I1 | 1 | I1 |
| X | X | ↑ | 1 |
| X | X | ↓ | 1 |

BUFGMUX_CTRL

Primitive: 2-to-1 Global Clock MUX Buffer

Introduction

This design element is a global clock buffer with two clock inputs, one clock output, and a select line used to cleanly select between one of two clocks driving the global clocking resource. This component is based on BUFGCTRL, with some pins connected to logic High or Low. This element uses the S pin as the select pin for the 2-to-1 MUX. S can switch anytime without causing a glitch on the output clock of the buffer.

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|---|
| I0 | Input | 1 | Clock buffer input. This input is reflected on the output O when the S input is zero. |
| I1 | Input | 1 | Clock buffer input. This input is reflected on the output O when the S input is one. |
| O | Output | 1 | Clock buffer output. |
| S | Input | 1 | Clock buffer select input. When low, selects I0 input and when high, the I1 input is selected |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

BUFH

Primitive: HROW Clock Buffer for a Single Clocking Region

Introduction

The BUFH primitive allows direct access to the clock region entry point of the global buffer (BUFG) resource. This allows access to unused portions of the global clocking network to be used as high-speed, low skew local (single clock region) routing resources. Please refer to the 7 series FPGA Clocking Resources User Guide for details for using this component.

Port Descriptions

| Port | Type | Width | Function |
|------|--------|-------|--------------|
| I | Input | 1 | Clock input |
| O | Output | 1 | Clock output |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- BUFH: HROW Clock Buffer for a Single Clocking Region
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

BUFH_inst : BUFH
port map (
  O => O, -- 1-bit output: Clock output
  I => I  -- 1-bit input: Clock input
);

-- End of BUFH_inst instantiation
```

Verilog Instantiation Template

```
// BUFH: HROW Clock Buffer for a Single Clocking Region
//      7 Series
// Xilinx HDL Libraries Guide, version 14.7

BUFHCE

Primitive: HROW Clock Buffer for a Single Clocking Region with Clock Enable

Introduction

The BUFHCE primitive allows direct access to the clock region entry point of the global buffer (BUFG) resource. This allows access to unused portions of the global clocking network to be used as high-speed, low skew local (single clock region) routing resources. Additionally, the CE or clock enable input allows for finer-grained control of clock enabling or gating to allow for power reduction for circuitry or portions of the design not constantly used. Please refer to the 7 series FPGA Clocking Resources User Guide for details for using this component.

Port Descriptions

| Port | Type | Width | Function |
|------|--------|-------|--|
| CE | Input | 1 | Enables propagation of signal from I to O. When low, performs a glitchless transition of the output to INIT_OUT value. |
| I | Input | 1 | Clock input |
| O | Output | 1 | Clock output |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|-----------|---------|------------------|---------|--|
| CE_TYPE | STRING | "SYNC", "ASYN" " | "SYNC" | Sets clock enable behavior where "SYNC" allows for a glitchless transition to and from the INIT_OUT value. "ASYN" is generally used to create a more immediate transition such as when you can expect the clock to be stopped or when using the BUFHCE for a high fanout control or data path routing instead of a clock buffer. |
| INIT_OUT | DECIMAL | 0, 1 | 0 | Initial output value, also indicates stop low vs stop high behavior |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- BUFHCE: HROW Clock Buffer for a Single Clocking Region with Clock Enable
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

BUFHCE_inst : BUFHCE
generic map (
    CE_TYPE => "SYNC", -- "SYNC" (glitchless switching) or "ASYNC" (immediate switch)
    INIT_OUT => 0      -- Initial output value (0-1)
)
port map (
    O => O, -- 1-bit output: Clock output
    CE => CE, -- 1-bit input: Active high enable
    I => I -- 1-bit input: Clock input
);

-- End of BUFHCE_inst instantiation
```

Verilog Instantiation Template

```
// BUFHCE: HROW Clock Buffer for a Single Clocking Region with Clock Enable
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

BUFHCE #(
    .CE_TYPE("SYNC"), // "SYNC" (glitchless switching) or "ASYNC" (immediate switch)
    .INIT_OUT(0)      // Initial output value (0-1)
)
BUFHCE_inst (
    .O(O), // 1-bit output: Clock output
    .CE(CE), // 1-bit input: Active high enable
    .I(I) // 1-bit input: Clock input
);

// End of BUFHCE_inst instantiation
```

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

BUFIO

Primitive: Local Clock Buffer for I/O

Introduction

This design element is simply a clock-in, clock-out buffer. It drives a dedicated clock net within the I/O column, independent of the global clock resources. Thus, these elements are ideally suited for source-synchronous data capture (forwarded/receiver clock distribution). They can be driven by a dedicated MRCC I/O located in the same clock region or a BUFMRCE/BUFMR component capable of clocking multiple clock regions. The BUFIO can only drive I/O components within the bank in which they exist. These elements cannot directly drive logic resources (CLB, block RAM, etc.) because the I/O clock network only reaches the I/O column.

Port Descriptions

| Port | Type | Width | Function |
|------|--------|-------|---|
| I | Input | 1 | Input port to clock buffer. Connect this to an IBUF connected to a top-level port or an associated BUFMR buffer. |
| O | Output | 1 | Output port from clock buffer. Connect this to the clock inputs to synchronous I/O components like the ISERDESE2, OSERDESE2, IDDR, ODDR or register connected directly to an I/O port (inferred or instantiated). |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- BUFIO: Local Clock Buffer for I/O
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

BUFIO_inst : BUFIO
port map (
  O => O, -- 1-bit output: Clock output (connect to I/O clock loads).
  I => I -- 1-bit input: Clock input (connect to an IBUF or BUFMR).
);

-- End of BUFIO_inst instantiation
```

Verilog Instantiation Template

```
// BUFIO: Local Clock Buffer for I/O
//      7 Series
// Xilinx HDL Libraries Guide, version 14.7

BUFIO BUFIO_inst (
    .O(O), // 1-bit output: Clock output (connect to I/O clock loads).
    .I(I) // 1-bit input: Clock input (connect to an IBUF or BUFMR).
);

// End of BUFIO_inst instantiation
```

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

BUFMR

Primitive: Multi-Region Clock Buffer

Introduction

The BUFMR is a simple clock-in/clock-out buffer. The BUFMR replaces the multi-region/bank support of the BUFR and BUFIO available in prior Virtex architectures. There are two BUFMRs in every bank and each buffer can be driven by one specific MRCC in the same bank. The BUFMRs drive the BUFIOs and/or BUFRs in the same region/banks and in the region above and below via the I/O clocking backbone. It is not suggested to use a BUFMR when driving BUFRs using clock dividers (not in bypass) and instead use a BUFMRCE component.

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| I | Input | 1 | BUFMR clock input pin. Connect to an IBUF input that in turn is directly connected to a MRCC I/O port. |
| O | Output | 1 | BUFMR clock output pin. Connect to BUFIOs and/or BUFRs to be driven in adjacent regions. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- BUFMR: Multi-Region Clock Buffer
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

BUFMR_inst : BUFMR
port map (
  O => O, -- 1-bit output: Clock output (connect to BUFIOs/BUFRs)
  I => I  -- 1-bit input: Clock input (Connect to IBUF)
);

-- End of BUFMR_inst instantiation
```

Verilog Instantiation Template

```
// BUFMR: Multi-Region Clock Buffer
//      7 Series
// Xilinx HDL Libraries Guide, version 14.7

BUFMR BUFMR_inst (
    .O(O), // 1-bit output: Clock output (connect to BUFIOs/BUFRs)
    .I(I) // 1-bit input: Clock input (Connect to IBUF)
);

// End of BUFMR_inst instantiation
```

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

BUFMRCE

Primitive: Multi-Region Clock Buffer with Clock Enable

Introduction

The BUFMRCE is a simple clock-in/clock-out buffer with clock with clock enable (CE). Asserting CE stops the output clock to a user specified value. The BUFMRCE replaces the multi-region/bank support of the BUFR and BUFIO available in prior Virtex architectures. There are two BUFMRCEs in every bank and each buffer can be driven by one specific MRCC in the same bank. The BUFMRCE drives the BUFIOs and/or BUFRs in the same region/banks and in the region above and below via the I/O clocking backbone. When using BUFR dividers (not in bypass), the BUFMRCE must be disabled by deasserting the CE pin, the BUFR must be reset (cleared by asserting CLR), and then the CE signal should be asserted. This sequence ensures that all BUFR output clocks are phase aligned. If the dividers within the BUFRs are not used, then this additional circuitry is not necessary. If the clock enable circuitry is not needed, a BUFMR component should be used in place of a BUFMRCE.

Port Descriptions

| Port | Type | Width | Function |
|------|--------|-------|--|
| CE | Input | 1 | Active high buffer enable input. When low, output will settle to INIT_OUT value. |
| I | Input | 1 | BUFMR clock input pin. Connect to an IBUF input that in turn is directly connected to a MRCC I/O port. |
| O | Output | 1 | BUFMR clock output pin. Connect to BUFIOs and/or BUFRs to be driven in the same and adjacent regions. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|-----------|---------|------------------|---------|--|
| CE_TYPE | STRING | "SYNC", "ASYNCR" | "SYNC" | Set to "SYNC" for CE to be synchronous to input I and create a glitchless output. Set to "ASYNCR" for stopped clock or non-clock operation of the CE signal. |
| INIT_OUT | DECIMAL | 0, 1 | 0 | Initial output value, also indicates stop low vs stop high behavior |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- BUFMRCE: Multi-Region Clock Buffer with Clock Enable
--           7 Series
-- Xilinx HDL Libraries Guide, version 14.7

BUFMRCE_inst : BUFMRCE
generic map (
  CE_TYPE => "SYNC", -- SYNC, ASYNC
  INIT_OUT => 0      -- Initial output and stopped polarity, (0-1)
)
port map (
  O => O, -- 1-bit output: Clock output (connect to BUFIOs/BUFRs)
  CE => CE, -- 1-bit input: Active high buffer enable
  I => I -- 1-bit input: Clock input (Connect to IBUF)
);

-- End of BUFMRCE_inst instantiation
```

Verilog Instantiation Template

```
// BUFMRCE: Multi-Region Clock Buffer with Clock Enable
//           7 Series
// Xilinx HDL Libraries Guide, version 14.7

BUFMRCE #(
  .CE_TYPE("SYNC"), // SYNC, ASYNC
  .INIT_OUT(0)      // Initial output and stopped polarity, (0-1)
)
BUFMRCE_inst (
  .O(O), // 1-bit output: Clock output (connect to BUFIOs/BUFRs)
  .CE(CE), // 1-bit input: Active high buffer enable
  .I(I) // 1-bit input: Clock input (Connect to IBUF)
);

// End of BUFMRCE_inst instantiation
```

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

BUFR

Primitive: Regional Clock Buffer for I/O and Logic Resources within a Clock Region

Introduction

The BUFR is a regional clock buffer available in 7 series devices. BUFRs drive clock signals to a dedicated clock net within a clock region, independent from the global clock tree. Each BUFR can drive the regional clock nets in the region in which it is located. Unlike BUFIOs, BUFRs can drive the I/O logic and logic resources (CLB, block RAM, etc.) in the existing clock region. BUFRs can be driven by either the output from an IBUFG, BUFMRCE, MMCM or local interconnect. In addition, BUFRs are capable of generating divided clock outputs with respect to the clock input. The divide value is an integer between one and eight. BUFRs are ideal for source-synchronous applications requiring clock domain crossing or serial-to-parallel conversion. There are two BUFRs in a typical clock region (two regional clock networks). If local clocking is needed in multiple clock regions, the BUFMRCE can drive multiple BUFRs in adjacent clock regions to further extend this clocking capability. Please refer to the BUFMRCE for more details.

Port Descriptions

| Port | Type | Width | Function |
|------|--------|-------|--|
| CE | Input | 1 | Clock enable port. When asserted low, this port disables the output clock. When asserted high, the clock is propagated out the O output port. Cannot be used in "BYPASS" mode. Connect to vcc when BUFR_DIVIDE is set to "BYPASS" or if not used. |
| CLR | Input | 1 | Counter asynchronous clear for divided clock output. When asserted high, this port resets the counter used to produce the divided clock output and the output is asserted low. Cannot be used in "BYPASS" mode. Connect to gnd when BUFR_DIVIDE is set to "BYPASS" or if not used. |
| I | Input | 1 | Clock input port. This port is the clock source port for BUFR. It can be driven by an IBUF, BUFMRCE, MMCM or local interconnect. |
| O | Output | 1 | Clock output port. This port drives the clock tracks in the clock region of the BUFR. This port connects to FPGA clocked components. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|-------------|--------|--|-----------|--|
| BUFR_DIVIDE | STRING | "BYPASS", "1", "2", "3", "4", "5", "6", "7", "8" | "BYPASS" | Defines whether the output clock is a divided version of input clock. |
| SIM_DEVICE | STRING | "7SERIES" | "7SERIES" | For correct simulation behavior, this attribute must be set to "7SERIES" when targeting a 7 series device. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- BUFR: Regional Clock Buffer for I/O and Logic Resources within a Clock Region
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

BUFR_inst : BUFR
generic map (
    BUFR_DIVIDE => "BYPASS",    -- Values: "BYPASS, 1, 2, 3, 4, 5, 6, 7, 8"
    SIM_DEVICE => "7SERIES"    -- Must be set to "7SERIES"
)
port map (
    O => O,        -- 1-bit output: Clock output port
    CE => CE,     -- 1-bit input: Active high, clock enable (Divided modes only)
    CLR => CLR,   -- 1-bit input: Active high, asynchronous clear (Divided modes only)
    I => I        -- 1-bit input: Clock buffer input driven by an IBUF, MMCM or local interconnect
);

-- End of BUFR_inst instantiation
```

Verilog Instantiation Template

```
// BUFR: Regional Clock Buffer for I/O and Logic Resources within a Clock Region
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

BUFR #(
    .BUFR_DIVIDE("BYPASS"),    // Values: "BYPASS, 1, 2, 3, 4, 5, 6, 7, 8"
    .SIM_DEVICE("7SERIES")    // Must be set to "7SERIES"
)
BUFR_inst (
    .O(O),        // 1-bit output: Clock output port
    .CE(CE),     // 1-bit input: Active high, clock enable (Divided modes only)
    .CLR(CLR),   // 1-bit input: Active high, asynchronous clear (Divided modes only)
    .I(I)        // 1-bit input: Clock buffer input driven by an IBUF, MMCM or local interconnect
);

// End of BUFR_inst instantiation
```

For More Information

CAPTUREE2

Primitive: Register Capture

Introduction

This element provides user control and synchronization over when and how the capture register (flip-flop and latch) information task is requested. The readback function is provided through dedicated configuration port instructions. However, without this element, the readback data is synchronized to the configuration clock. Only register (flip-flop and latch) states can be captured. Although LUT RAM, SRL, and block RAM states are readback, they cannot be captured. An asserted high CAP signal indicates that the registers in the device are to be captured at the next Low-to-High clock transition. By default, data is captured after every trigger when transition on CLK while CAP is asserted. To limit the readback operation to a single data capture, add the ONESHOT=TRUE attribute to this element.

Port Descriptions

| Port | Type | Width | Function |
|------|-------|-------|---------------|
| CAP | Input | 1 | Capture Input |
| CLK | Input | 1 | Clock Input |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|-----------|--------|-----------------|---------|---|
| ONESHOT | STRING | "TRUE", "FALSE" | "TRUE" | Specifies the procedure for performing single readback per CAP trigger. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- CAPTUREE2: Register Capture
--           7 Series
-- Xilinx HDL Libraries Guide, version 14.7

CAPTUREE2_inst : CAPTUREE2
generic map (
    ONESHOT => "TRUE" -- Specifies the procedure for performing single readback per CAP trigger.
)
port map (
    CAP => CAP, -- 1-bit input: Capture Input
    CLK => CLK  -- 1-bit input: Clock Input
);

-- End of CAPTUREE2_inst instantiation
```

Verilog Instantiation Template

```
// CAPTUREE2: Register Capture
//           7 Series
// Xilinx HDL Libraries Guide, version 14.7

CAPTUREE2 #(
    .ONESHOT("TRUE") // Specifies the procedure for performing single readback per CAP trigger.
)
CAPTUREE2_inst (
    .CAP(CAP), // 1-bit input: Capture Input
    .CLK(CLK) // 1-bit input: Clock Input
);

// End of CAPTUREE2_inst instantiation
```

CARRY4

Primitive: Fast Carry Logic with Look Ahead

Introduction

This circuit design represents the fast carry logic for a slice. The carry chain consists of a series of four MUXes and four XORs that connect to the other logic (LUTs) in the slice via dedicated routes to form more complex functions. The fast carry logic is useful for building arithmetic functions like adders, counters, subtractors and add/subs, as well as such other logic functions as wide comparators, address decoders, and some logic gates (specifically, AND and OR).

Port Descriptions

| Port | Direction | Width | Function |
|--------|-----------|-------|--|
| O | Output | 4 | Carry chain XOR general data out |
| CO | Output | 4 | Carry-out of each stage of the carry chain |
| DI | Input | 4 | Carry-MUX data input |
| S | Input | 4 | Carry-MUX select line |
| CYINIT | Input | 1 | Carry-in initialization input |
| CI | Input | 1 | Carry cascade input |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

VHDL Instantiation Template

CFGLUT5

Primitive: 5-input Dynamically Reconfigurable Look-Up Table (LUT)

Introduction

This element is a runtime, dynamically reconfigurable, 5-input look-up table (LUT) that enables the changing of the logical function of the LUT during circuit operation. Using the CDI pin, a new INIT value can be synchronously shifted in serially to change the logical function. The O6 output pin produces the logical output function, based on the current INIT value loaded into the LUT and the currently selected I0-I4 input pins. Optionally, you can use the O5 output in combination with the O6 output to create two individual 4-input functions sharing the same inputs or a 5-input function and a 4-input function that uses a subset of the 5-input logic (see tables below). This component occupies one of the four LUT6 components within a Slice-M.

To cascade this element, connect the CDO pin from each element to the CDI input of the next element. This will allow a single serial chain of data (32-bits per LUT) to reconfigure multiple LUTs.

Port Descriptions

| Port | Direction | Width | Function |
|--------------------|-----------|-------|--|
| O6 | Output | 1 | 5-LUT output |
| O5 | Output | 1 | 4-LUT output |
| I0, I1, I2, I3, I4 | Input | 1 | LUT inputs |
| CDO | Output | 1 | Reconfiguration data cascaded output (optionally connect to the CDI input of a subsequent LUT) |
| CDI | Input | 1 | Reconfiguration data serial input |
| CLK | Input | 1 | Reconfiguration clock |
| CE | Input | 1 | Active high reconfiguration clock enable |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

- Connect the CLK input to the clock source used to supply the reconfiguration data.
- Connect the CDI input to the source of the reconfiguration data.
- Connect the CE pin to the active high logic if you need to enable/disable LUT reconfiguration.
- Connect the I4-I0 pins to the source inputs to the logic equation. The logic function is output on O6 and O5.
- To cascade this element, connect the CDO pin from each element to the CDI input of the next element to allow a single serial chain of data to reconfigure multiple LUTs.

The INIT attribute should be placed on this design element to specify the initial logical function of the LUT. A new INIT can be loaded into the LUT any time during circuit operation by shifting in 32-bits per LUT in the chain, representing the new INIT value. Disregard the O6 and O5 output data until all 32-bits of new INIT data has been clocked into the LUT. The logical function of the LUT changes as new INIT data is shifted into it. Data should be shifted in MSB (INIT[31]) first and LSB (INIT[0]) last.

In order to understand the O6 and O5 logical value based on the current INIT, see the table below:

| I4 I3 I2 I1 I0 | O6 Value | O5 Value |
|----------------|----------|----------|
| 1 1 1 1 1 | INIT[31] | INIT[15] |
| 1 1 1 1 0 | INIT[30] | INIT[14] |
| ... | ... | ... |
| 1 0 0 0 1 | INIT[17] | INIT[1] |
| 1 0 0 0 0 | INIT[16] | INIT[0] |
| 0 1 1 1 1 | INIT[15] | INIT[15] |
| 0 1 1 1 0 | INIT[14] | INIT[14] |
| ... | ... | ... |
| 0 0 0 0 1 | INIT[1] | INIT[1] |
| 0 0 0 0 0 | INIT[0] | INIT[0] |

For instance, the INIT value of FFFF8000 would represent the following logical equations:

- O6 = I4 or (I3 and I2 and I1 and I0)
- O5 = I3 and I2 and I1 and I0

To use these elements as two, 4-input LUTs with the same inputs but different functions, tie the I4 signal to a logical one. The INIT[31:16] values apply to the logical values of the O6 output and INIT [15:0] apply to the logical values of the O5 output.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|------------------|-----------|---|
| INIT | Hexadecimal | Any 32-bit Value | All zeros | Specifies the initial logical expression of this element. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

DCIRESET

Primitive: Digitally Controlled Impedance Reset Component

Introduction

This design element is used to reset the Digitally Controlled Impedance (DCI) state machine after configuration has been completed. By toggling the RST input to the DCIRESET primitive while the device is operating, the DCI state-machine is reset and both phases of impedance adjustment proceed in succession. All I/Os using DCI will be unavailable until the LOCKED output from the DCIRESET block is asserted

Port Descriptions

| Port | Type | Width | Function |
|--------|--------|-------|---|
| LOCKED | Output | 1 | DCI state-machine LOCK status output. When low, DCI I/O impedance is being calibrated and DCI I/Os are unavailable. Upon a low-to-high assertion, DCI I/Os are available for use. |
| RST | Input | 1 | Active-high asynchronous reset input to DCI state-machine. After RST is asserted, I/Os utilizing DCI will be unavailable until LOCKED is asserted. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

DNA_PORT

Primitive: Device DNA Access Port

Introduction

The DNA_PORT allows access to a dedicated shift register that can be loaded with the Device DNA data bits (factory-programmed, read-only unique ID) for a given 7 series device. In addition to shifting out the DNA data bits, this component allows for the inclusion of supplemental bits of your data, or allows for the DNA data to rollover (repeat DNA data after initial data has been shifted out). This component is primarily used in conjunction with other circuitry to build added copy protection for the FPGA bitstream from possible theft. Connect all inputs and outputs to the design to ensure proper operation. To access the Device DNA data, you must first load the shift register by setting the active high READ signal for one clock cycle. After the shift register is loaded, the data can be synchronously shifted out by enabling the active high SHIFT input and capturing the data out the DOUT output port. Additional data can be appended to the end of the 57-bit shift register by connecting the appropriate logic to the DIN port. If DNA data rollover is desired, connect the DOUT port directly to the DIN port to allow for the same data to be shifted out after completing the 57-bit shift operation. If no additional data is necessary, the DIN port can be tied to a logic zero. The attribute SIM_DNA_VALUE can be optionally set to allow for simulation of a possible DNA data sequence. By default, the Device DNA data bits are all zeros in the simulation model.

Port Descriptions

| Port | Type | Width | Function |
|-------|--------|-------|--|
| CLK | Input | 1 | Clock input. |
| DIN | Input | 1 | User data input pin. |
| DOUT | Output | 1 | DNA output data. |
| READ | Input | 1 | Active high load DNA, active low read input. |
| SHIFT | Input | 1 | Active high shift enable input. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|---------------|------|-----------------------|-----------|--|
| SIM_DNA_VALUE | HEX | Any 57-bit HEX number | All zeros | Specifies a sample 57-bit DNA value for simulation |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- DNA_PORT: Device DNA Access Port
--           7 Series
-- Xilinx HDL Libraries Guide, version 14.7

DNA_PORT_inst : DNA_PORT
generic map (
  SIM_DNA_VALUE => X"0000000000000000" -- Specifies a sample 57-bit DNA value for simulation
)
port map (
  DOUT => DOUT, -- 1-bit output: DNA output data.
  CLK => CLK, -- 1-bit input: Clock input.
  DIN => DIN, -- 1-bit input: User data input pin.
  READ => READ, -- 1-bit input: Active high load DNA, active low read input.
  SHIFT => SHIFT -- 1-bit input: Active high shift enable input.
);

-- End of DNA_PORT_inst instantiation
```

Verilog Instantiation Template

```
// DNA_PORT: Device DNA Access Port
//           7 Series
// Xilinx HDL Libraries Guide, version 14.7

DNA_PORT #(
  .SIM_DNA_VALUE(57'h0000000000000000) // Specifies a sample 57-bit DNA value for simulation
)
DNA_PORT_inst (
  .DOUT(DOUT), // 1-bit output: DNA output data.
  .CLK(CLK), // 1-bit input: Clock input.
  .DIN(DIN), // 1-bit input: User data input pin.
  .READ(READ), // 1-bit input: Active high load DNA, active low read input.
  .SHIFT(SHIFT) // 1-bit input: Active high shift enable input.
);

// End of DNA_PORT_inst instantiation
```

DSP48E1

Primitive: 48-bit Multi-Functional Arithmetic Block

Introduction

This design element is a versatile, scalable, hard IP block within 7 series devices that allows for the creation of compact, high-speed, arithmetic-intensive operations, such as those seen for many DSP algorithms. Some of the functions capable within the block include multiplication, addition, subtraction, accumulation, shifting, logical operations and pattern detection.

Port Descriptions

| Port | Type | Width | Function |
|------------------|--------|-------|--|
| A<29:0> | Input | 30 | Data input for preadder, multiplier, adder/subtractor/accumulator, ALU or concatenation operations. When used with the multiplier or preadder, 25 bits of data (A[24:0]) is used and upper bits (A[29:25]) are unused and may be tied to ground. When using the internal adder/subtractor/accumulator or ALU circuit, all 30 bits are used (A[29:0]). When used in concatenation mode, all 30 bits are used and this constitutes the MSB (upper) bits of the concatenated vector. |
| ACIN<29:0> | Input | 30 | Cascaded data input from ACOUT of previous DSP48E1 slice (muxed with A). If not used, tie port to all zeros. |
| ACOUT<29:0> | Output | 30 | Cascaded data output to ACIN of next DSP48E1 slice. If not used, leave unconnected. |
| ALUMODE<3:0> | Input | 4 | Controls the selection of the logic function in the DSP48E1 slice. |
| B<17:0> | Input | 18 | The B input of the multiplier. B[17:0] are the least significant bits (LSBs) of the A:B concatenated input to the second-stage adder/subtractor or logic function. |
| BCIN<17:0> | Input | 18 | Cascaded data input from BCOUT of previous DSP48E1 slice (muxed with B). If not used, tie port to all zeros. |
| BCOUT<17:0> | Output | 18 | Cascaded data output to BCIN of next DSP48E1 slice. If not used, leave unconnected. |
| C<47:0> | Input | 48 | Data input to the second-stage adder/subtractor, pattern detector, or logic function. |
| CARRYCASCIN | Input | 1 | Cascaded carry input from CARRYCASCOUT of previous DSP48E1 slice. |
| CARRYCASCOUT | Output | 1 | Cascaded carry output to CARRYCASCIN of next DSP48E1 slice. This signal is internally fed back into the CARRYINSEL multiplexer input of the same DSP48E1 slice. |
| CARRYIN | Input | 1 | Carry input from the FPGA logic. |
| CARRYINSEL <2:0> | Input | 3 | Selects the carry source: <ul style="list-style-type: none"> • 0 1 1 - PCIN[47] - Rounding PCIN (round towards zero) • 1 0 0 - CARRYCASCOUT - For larger add/sub/acc (sequential operation via internal feedback). Must select with PREG=1 • 1 0 1 - ~P[47] - Rounding P (round towards infinity). Must select with PREG=1 • 1 1 0 - A[24] - XNOR B[17] Rounding A x B • 1 1 1 - P[47] - For rounding P (round towards zero). Must select with PREG=1 |
| CARRYOUT<3:0> | Output | 4 | 4-bit carry output from each 12-bit field of the accumulate/adder/logic unit. Normal 48-bit operation uses only CARRYOUT3. SIMD operation can use four carry out bits (CARRYOUT[3:0]). |
| CEAD | Input | 1 | Active high, clock enable for the pre-adder output AD pipeline register. Tie to logic one if not used and ADREG=1. Tie to logic zero if ADREG=0. |
| CEALUMODE | Input | 1 | Active High, clock enable for ALUMODE (control inputs) registers (ALUMODEREG=1). Tie to logic one if not used. |

| Port | Type | Width | Function |
|-------------|--------|-------|--|
| CEA1 | Input | 1 | Active high, clock enable for the first A (input) register. This port is only used if AREG=2 or INMODE0 = 1. Tie to logic one if not used and AREG=2. Tie to logic zero if AREG=0 or 1. When two registers are used, this is the first sequentially. When Dynamic AB Access is used, this clock enable is applied for INMODE[0]=1. |
| CEA2 | Input | 1 | Active high, clock enable for the second A (input) register. This port is only used if AREG=1 or 2. Tie to logic one if not used and AREG=1 or 2. Tie to logic zero if AREG=0. When two registers are used, this is the second sequentially. When one register is used (AREG=1), CEA2 is the clock enable. |
| CEB1 | Input | 1 | Active high, Clock enable for the first B (input) register. This port is only used if BREG=2 or INMODE4=1. Tie to logic one if not used and BREG=2. Tie to logic zero if BREG=0 or 1. When two registers are used, this is the first sequentially. When Dynamic AB Access is used, this clock enable is applied for INMODE[4]=1. |
| CEB2 | Input | 1 | Active high, clock enable for the second B (input) register. This port is only used if BREG=1 or 2. Tie to logic one if not used and BREG=1 or 2. Tie to logic zero if BREG=0. When two registers are used, this is the second sequentially. When one register is used (BREG=1), CEB2 is the clock enable. |
| CEC | Input | 1 | Active High, Clock enable for the C (input) register (CREG=1). Tie to logic one if not used. |
| CECARRYIN | Input | 1 | Active high, clock enable for the CARRYIN (input from fabric) register (CARRYINREG=1). Tie to logic one if not used. |
| CECTRL | Input | 1 | Active high, clock enable for the OPMODE and CARRYINSEL (control inputs) registers (OPMODEREG=1 or CARRYINSELREG=1). Tie to logic one if not used. |
| CED | Input | 1 | Active high, Clock enable for the D (input) registers (DREG=1). Tie to logic one if not used. |
| CEINMODE | Input | 1 | Active high, clock enable for the INMODE control input registers (INMODEREG=1). Tie to logic one if not used. |
| CEM | Input | 1 | Active high, Clock enable for the post-multiply M (pipeline) register and the internal multiply round CARRYIN register (MREG=1). Tie to logic one if not used. |
| CEP | Input | 1 | Active high, clock enable for the P (output) register (PREG=1). Tie to logic one if not used. |
| CLK | Input | 1 | This port is the DSP48E1 input clock, common to all internal registers and flip-flops. |
| D<24:0> | Input | 25 | 25-bit data input to the pre-adder or alternative input to the multiplier. The pre-adder implements $D + A$ as determined by the INMODE3 signal. |
| INMODE<4:0> | Input | 5 | These five control bits select the functionality of the pre-adder, the A, B, and D inputs, and the input registers. These bits should be tied to all zeroes if not used. |
| MULTSIGNIN | Input | 1 | Sign of the multiplied result from the previous DSP48E1 slice for MACC extension. Either connect to the MULTSIGNOUT of another DSP block or tie to ground if not used. |
| MULTSIGNOUT | Output | 1 | Sign of the multiplied result cascaded to the next DSP48E1 slice for MACC extension. Either connect to the MULTSIGNIN of another DSP block or tie to ground if not used. |
| OPMODE<6:0> | Input | 7 | Controls the input to the X, Y, and Z multiplexers in the DSP48E1 slice dictating the operation or function of the DSP slice. |

| Port | Type | Width | Function |
|----------------|--------|-------|---|
| OVERFLOW | Output | 1 | Active high Overflow indicator when used with the appropriate setting of the pattern detector and PREG=1. |
| P<47:0> | Output | 48 | Data output from second stage adder/subtractor or logic function. |
| PATTERNBDETECT | Output | 1 | Active high match indicator between P[47:0] and the pattern bar. |
| PATTERNDETECT | Output | 1 | Active high Match indicator between P[47:0] and the pattern gated by the MASK. Result arrives on the same cycle as P. |
| PCIN<47:0> | Input | 48 | Cascaded data input from PCOUT of previous DSP48E1 slice to adder. If used, connect to PCOUT of upstream cascaded DSP slice. If not used, tie port to all zeros. |
| PCOUT<47:0> | Output | 48 | Cascaded data output to PCIN of next DSP48E1 slice. If used, connect to PCIN of downstream cascaded DSP slice. If not used, leave unconnected. |
| RSTA | Input | 1 | Active high, synchronous Reset for both A (input) registers (AREG=1 or 2). Tie to logic zero if not used. |
| RSTALLCARRYIN | Input | 1 | Active high, synchronous reset for the Carry (internal path) and the CARRYIN registers (CARRYINREG=1). Tie to logic zero if not used. |
| RSTALUMODE | Input | 1 | Active high, synchronous Reset for ALUMODE (control inputs) registers (ALUMODEREG=1). Tie to logic zero if not used. |
| RSTB | Input | 1 | Active high, synchronous Reset for both B (input) registers (BREG=1 or 2). Tie to logic zero if not used. |
| RSTC | Input | 1 | Active high, synchronous reset for the C (input) registers (CREG=1). Tie to logic zero if not used. |
| RSTCTRL | Input | 1 | Active High, synchronous reset for OPMODE and CARRYINSEL (control inputs) registers (OPMODEREG=1 and/or CARRYINSELREG=1). Tie to logic zero if not used. |
| RSTD | Input | 1 | Active high, synchronous reset for the D (input) register and for the pre-adder (output) AD pipeline register (DREG=1 and/or ADREG=1). Tie to logic zero if not used. |
| RSTINMODE | Input | 1 | Active high, synchronous reset for the INMODE (control input) registers (INMODEREG=1). Tie to logic zero if not used. |
| RSTM | Input | 1 | Active high, synchronous reset for the M (pipeline) registers (MREG=1). Tie to logic zero if not used. |
| RSTP | Input | 1 | Active high, synchronous reset for the P (output) registers (PREG=1). Tie to logic zero if not used. |
| UNDERFLOW | Output | 1 | Active high underflow indicator when used with the appropriate setting of the pattern detector and PREG=1. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | Yes |
| Macro support | Yes |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|------------------|---------|--|------------|---|
| ACASCREG | DECIMAL | 1, 0, 2 | 1 | In conjunction with AREG, selects the number of A input registers on the A cascade path, ACOUT. This attribute must be equal to or one less than the AREG value: AREG=0: ACASCREG must be 0 AREG=1: ACASCREG must be 1 AREG=2: ACASCREG can be 1 or 2 |
| ADREG | DECIMAL | 1, 0 | 1 | Selects the number of AD pipeline registers. Set to 1 to use the AD pipeline registers. |
| A_INPUT | STRING | "DIRECT", "CASCADE" | "DIRECT" | Selects the input to the A port between parallel input ("DIRECT") or the cascaded input from the previous slice ("CASCADE"). |
| ALUMODEREG | DECIMAL | 1, 0 | 1 | Selects the number of ALUMODE input registers. Set to 1 to register the ALUMODE inputs. |
| AREG | DECIMAL | 1, 0, 2 | 1 | Selects the number of A input pipeline registers. |
| AUTORESET_PATDET | STRING | "NO_RESET", "RESET_MATCH", "RESET_NOT_MATCH" | "NO_RESET" | Automatically resets the P Register (accumulated value or counter value) on the next clock cycle, if a pattern detect event has occurred on this clock cycle. The "RESET_MATCH" and "RESET_NOT_MATCH" settings distinguish between whether the DSP48E1 slice should cause an auto reset of the P Register on the next cycle: - if the pattern is matched or - whenever the pattern is not matched on the current cycle but was matched on the previous clock cycle. |
| BCASCREG | DECIMAL | 1, 0, 2 | 1 | In conjunction with BREG, selects the number of B input registers on the B cascade path, BCOUT. This attribute must be equal to or one less than the BREG value: BREG=0: BCASCREG must be 0 BREG=1: BCASCREG must be 1 BREG=2: BCASCREG can be 1 or 2 |
| B_INPUT | STRING | "DIRECT", "CASCADE" | "DIRECT" | Selects the input to the B port between parallel input ("DIRECT") or the cascaded input from the previous slice ("CASCADE"). |
| BREG | DECIMAL | 1, 0, 2 | 1 | Selects the number of B input registers. |
| CARRYINREG | DECIMAL | 1, 0 | 1 | Selects the number of CARRYIN input registers. Set to 1 to register the CARRYIN inputs. |
| CARRYINSELREG | DECIMAL | 1, 0 | 1 | Selects the number of CARRYINSEL input registers. Set to 1 to register the CARRYINSEL inputs. |
| CREG | DECIMAL | 1, 0 | 1 | Selects the number of C input registers. Set to 1 to register the C inputs. |
| DREG | DECIMAL | 1, 0 | 1 | Selects the number of D input registers. Set to 1 to register the D inputs. |
| INMODEREG | DECIMAL | 1, 0 | 1 | Selects the number of INMODE input registers. Set to 1 to register the INMODE inputs. |
| MASK | HEX | 48-bit HEX | All ones | This 48-bit value is used to mask out certain bits during a pattern detection. When a MASK bit is set to 1, the corresponding pattern bit is ignored. When a MASK bit is set to 0, the pattern bit is compared. |

| Attribute | Type | Allowed Values | Default | Description |
|--------------------|---------|---|-------------|---|
| MREG | DECIMAL | 1, 0 | 1 | Selects the number of multiplier output (M) pipeline register stages. Set to 1 to use the M pipeline registers. |
| OPMODEREG | DECIMAL | 1, 0 | 1 | Selects the number of OPMODE input registers. Set to 1 to register the OPMODE inputs. |
| PATTERN | HEX | 48-bit HEX | All zeros | This 48-bit value is used in the pattern detector. |
| PREG | DECIMAL | 1, 0 | 1 | Selects the number of P output registers. Set to 1 to register the P outputs. The registered outputs will include CARRYOUT, CARRYCASCOU, MULTSIGNOUT, PATTERNB_DETECT, PATTERN_DETECT, and PCOUT. |
| SEL_MASK | STRING | "MASK", "C", "ROUNDING_MODE1", "ROUNDING_MODE2" | "MASK" | Selects the mask to be used for the pattern detector. The C and MASK settings are for standard uses of the pattern detector (counter, overflow detection, etc.). ROUNDING_MODE1 (C-bar left shifted by 1) and ROUNDING_MODE2 (C-bar left shifted by 2) select special masks based off of the optionally registered C port. These rounding modes can be used to implement convergent rounding in the DSP48E1 slice using the pattern detector. |
| SEL_PATTERN | STRING | "PATTERN", "C" | "PATTERN" | Selects the input source for the pattern field. The input source can either be a 48-bit dynamic C input or a 48-bit static PATTERN attribute field. |
| USE_DPORT | BOOLEAN | FALSE, TRUE | FALSE | Determines whether the pre-adder and the D Port are used or not. |
| USE_MULT | STRING | "MULTIPLY", "DYNAMIC", "NONE" | "MULTIPLY" | Selects usage of the multiplier. Set to "NONE" to save power when using only the Adder/Logic Unit. The "DYNAMIC" setting indicates that the user is switching between A*B and A:B operations on the fly and therefore needs to get the worst-case timing of the two paths. |
| USE_PATTERN_DETECT | STRING | "NO_PATDET", "PATDET" | "NO_PATDET" | Selects whether the pattern detector and related features are used ("PATDET") or not used ("NO_PATDET"). This attribute is used for speed specification and Simulation Model purposes only. |
| USE_SIMD | STRING | "ONE48", "FOUR12", "TWO24" | "ONE48" | Selects the mode of operation for the adder/subtractor. The attribute setting can be one 48-bit adder mode ("ONE48"), two 24-bit adder mode ("TWO24"), or four 12-bit adder mode ("FOUR12"). Selecting "ONE48" mode is compatible with Virtex-5 DSP48 operation and is not actually a true SIMD mode. Typical Multiply-Add operations are supported when the mode is set to "ONE48". When either "TWO24" or "FOUR12" mode is selected, the multiplier must not be used, and USE_MULT must be set to "NONE". |

EFUSE_USR

Primitive: 32-bit non-volatile design ID

X11150

Introduction

Provides internal access to the 32 non-volatile, user-programmable eFUSE bits

Port Descriptions

| Port | Type | Width | Function |
|----------------|--------|-------|----------------------------------|
| EFUSEUSR<31:0> | Output | 32 | User eFUSE register value output |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|-----------------|------|-----------------------------|--------------|---|
| SIM_EFUSE_VALUE | HEX | 32'h00000000 to 32'hfffffff | 32'h00000000 | Value of the 32-bit non-volatile value used in simulation |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```

Library UNISIM;
use UNISIM.vcomponents.all;

-- EFUSE_USR: 32-bit non-volatile design ID
--           7 Series
-- Xilinx HDL Libraries Guide, version 14.7

EFUSE_USR_inst : EFUSE_USR
generic map (
  SIM_EFUSE_VALUE => X"00000000" -- Value of the 32-bit non-volatile value used in simulation
)
port map (
  EFUSEUSR => EFUSEUSR -- 32-bit output: User eFUSE register value output
);

-- End of EFUSE_USR_inst instantiation

```

Verilog Instantiation Template

```
// EFUSE_USR: 32-bit non-volatile design ID
//           7 Series
// Xilinx HDL Libraries Guide, version 14.7

EFUSE_USR #(
    .SIM_EFUSE_VALUE(32'h00000000) // Value of the 32-bit non-volatile value used in simulation
)
EFUSE_USR_inst (
    .EFUSEUSR(EFUSEUSR) // 32-bit output: User eFUSE register value output
);

// End of EFUSE_USR_inst instantiation
```

FDCE

Primitive: D Flip-Flop with Clock Enable and Asynchronous Clear

Introduction

This design element is a single D-type flip-flop with clock enable and asynchronous clear. When clock enable (CE) is High and asynchronous clear (CLR) is Low, the data on the data input (D) of this design element is transferred to the corresponding data output (Q) during the Low-to-High clock (C) transition. When CLR is High, it overrides all other inputs and resets the data output (Q) Low. When CE is Low, clock transitions are ignored.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the STARTUP_E2 symbol.

Logic Table

| Inputs | | | | Outputs |
|--------|----|---|---|-----------|
| CLR | CE | D | C | Q |
| 1 | X | X | X | 0 |
| 0 | 0 | X | X | No Change |
| 0 | 1 | D | ↑ | D |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-----------|----------------|---------|---|
| INIT | Binary | 1, 0 | 0 | Sets the initial value of Q output after configuration. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- FDCE: Single Data Rate D Flip-Flop with Asynchronous Clear and
--       Clock Enable (posedge clk).
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

FDCE_inst : FDCE
generic map (
  INIT => '0') -- Initial value of register ('0' or '1')
port map (
  Q => Q,      -- Data output
  C => C,      -- Clock input
  CE => CE,    -- Clock enable input
  CLR => CLR,  -- Asynchronous clear input
  D => D      -- Data input
);

-- End of FDCE_inst instantiation
```

Verilog Instantiation Template

```
// FDCE: Single Data Rate D Flip-Flop with Asynchronous Clear and
//       Clock Enable (posedge clk).
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

FDCE #(
  .INIT(1'b0) // Initial value of register (1'b0 or 1'b1)
) FDCE_inst (
  .Q(Q),      // 1-bit Data output
  .C(C),      // 1-bit Clock input
  .CE(CE),    // 1-bit Clock enable input
  .CLR(CLR),  // 1-bit Asynchronous clear input
  .D(D)       // 1-bit Data input
);

// End of FDCE_inst instantiation
```

FDPE

Primitive: D Flip-Flop with Clock Enable and Asynchronous Preset

Introduction

This design element is a single D-type flip-flop with data (D), clock enable (CE), and asynchronous preset (PRE) inputs and data output (Q). The asynchronous PRE, when High, overrides all other inputs and sets the (Q) output High. Data on the (D) input is loaded into the flip-flop when PRE is Low and CE is High on the Low-to-High clock (C) transition. When CE is Low, the clock transitions are ignored.

For FPGA devices, this flip-flop is asynchronously preset, output High, when power is applied. Power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the STARTUP_E2 symbol.

Logic Table

| Inputs | | | | Outputs |
|--------|----|---|---|-----------|
| PRE | CE | D | C | Q |
| 1 | X | X | X | 1 |
| 0 | 0 | X | X | No Change |
| 0 | 1 | D | ↑ | D |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-----------|----------------|---------|--|
| INIT | Binary | 0, 1 | 1 | Sets the initial value of Q output after configuration |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- FDPE: Single Data Rate D Flip-Flop with Asynchronous Preset and
--       Clock Enable (posedge clk).
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

FDPE_inst : FDPE
generic map (
    INIT => '0') -- Initial value of register ('0' or '1')
port map (
    Q => Q,      -- Data output
    C => C,      -- Clock input
    CE => CE,    -- Clock enable input
    PRE => PRE,  -- Asynchronous preset input
    D => D       -- Data input
);

-- End of FDPE_inst instantiation
```

FDRE

Primitive: D Flip-Flop with Clock Enable and Synchronous Reset

Introduction

This design element is a single D-type flip-flop with data (D), clock enable (CE), and synchronous reset (R) inputs and data output (Q). The synchronous reset (R) input, when High, overrides all other inputs and resets the (Q) output Low on the Low-to-High clock (C) transition. The data on the (D) input is loaded into the flip-flop when R is Low and CE is High during the Low-to-High clock transition.

This flip-flop is asynchronously cleared, outputs Low, when power is applied. For FPGA devices, power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the STARTUP_E2 symbol.

Logic Table

| Inputs | | | | Outputs |
|--------|----|---|---|-----------|
| R | CE | D | C | Q |
| 1 | X | X | ↑ | 0 |
| 0 | 0 | X | X | No Change |
| 0 | 1 | D | ↑ | D |

Design Entry Method

| | |

FDSE

Primitive: D Flip-Flop with Clock Enable and Synchronous Set

X3723

Introduction

FDSE is a single D-type flip-flop with data (D), clock enable (CE), and synchronous set (S) inputs and data output (Q). The synchronous set (S) input, when High, overrides the clock enable (CE) input and sets the Q output High during the Low-to-High clock (C) transition. The data on the D input is loaded into the flip-flop when S is Low and CE is High during the Low-to-High clock (C) transition.

For FPGA devices, this flip-flop is asynchronously preset, output High, when power is applied. Power-on conditions are simulated when global set/reset (GSR) is active. GSR defaults to active-High but can be inverted by adding an inverter in front of the GSR input of the STARTUP_E2 symbol.

Logic Table

| Inputs | | | | Outputs |
|--------|----|---|---|-----------|
| S | CE | D | C | Q |
| 1 | X | X | ↑ | 1 |
| 0 | 0 | X | X | No Change |
| 0 | 1 | D | ↑ | D |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-----------|----------------|---------|--|
| INIT | Binary | 0, 1 | 1 | Sets the initial value of Q output after configuration |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;

FIFO18E1

Primitive: 18Kb FIFO (First-In-First-Out) Block RAM Memory

Introduction

7 series devices contain several block RAM memories, each of which can be separately configured as a FIFO, an automatic error-correction RAM, or as a general-purpose 36Kb or 18Kb RAM/ROM memory. These Block RAM memories offer fast and flexible storage of large amounts of on-chip data. The FIFO18E1 uses the FIFO control logic and the 18Kb Block RAM. This primitive can be used in a 4-bit wide by 4K deep, 9-bit wide by 2K deep, 18-bit wide by 1K deep, or a 36-bit wide by 512 deep configuration. The primitive can be configured in either synchronous or dual-clock (asynchronous) mode, with all associated FIFO flags and status signals.

When using the dual-clock mode with independent clocks, depending on the offset between read and write clock edges, the Empty, Almost Empty, Full and Almost Full flags can deassert one cycle later. Due to the asynchronous nature of the clocks the simulation model only reflects the deassertion latency cycles listed in the User Guide.

Note For a 36-bit wide by 512 deep FIFO, the "FIFO18_36" mode must be used. For deeper or wider configurations of the FIFO, the FIFO36E1 can be used. If error-correction circuitry is desired, the FIFO36E1 with "FIFO36_72" mode must be used.

Port Descriptions

| Port | Type | Width | Function |
|-------------|--------|-------|---|
| ALMOSTEMPTY | Output | 1 | Programmable flag to indicate the FIFO is almost empty. The ALMOST_EMPTY_OFFSET attribute specifies the threshold where this flag is triggered relative to full/empty. |
| ALMOSTFULL | Output | 1 | Programmable flag to indicate that the FIFO is almost full. The ALMOST_FULL_OFFSET attribute specifies the threshold where this flag is triggered relative to full/empty. |
| DI<31:0> | Input | 32 | FIFO data input bus. |
| DIP<3:0> | Input | 4 | FIFO parity data input bus. |
| DO<31:0> | Output | 32 | FIFO data output bus. |
| DOP<3:0> | Output | 4 | FIFO parity data output bus. |

| Port | Type | Width | Function |
|---------------|--------|-------|--|
| EMPTY | Output | 1 | Active high logic to indicate that the FIFO is currently empty. |
| FULL | Output | 1 | Active high logic indicates that the FIFO is full. |
| RDCLK | Input | 1 | Rising edge read clock. |
| RDCOUNT<11:0> | Output | 12 | Read count. |
| RDEN | Input | 1 | Active high FIFO read enable. |
| RDERR | Output | 1 | Read error occurred. |
| REGCE | Input | 1 | Output register clock enable for pipelined synchronous FIFO. DO_REG must be set to 1 if using this enable. |
| RST | Input | 1 | Active high (FIFO logic) asynchronous reset (for dual-clock FIFO), synchronous reset (for synchronous FIFO). Must be held for a minimum of 5 WRCLK/RDCLK cycles. |
| RSTREG | Input | 1 | Output register synchronous set/reset. DO_REG must be set to 1 if using this reset. |
| WRCLK | Input | 1 | Rising edge write clock. |
| WRCOUNT<11:0> | Output | 12 | Write count. |
| WREN | Input | 1 | Active high FIFO write enable. |
| WRERR | Output | 1 | Write error occurred. When the FIFO is full, any additional write operation generates an error flag. Synchronous with WRCLK. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | Recommended |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|---------------------|---------|----------------------|----------|---|
| ALMOST_EMPTY_OFFSET | HEX | 13'h0000 to 13'h1fff | 13'h0080 | Specifies the amount of data contents in the RAM to trigger the ALMOST_EMPTY flag. |
| ALMOST_FULL_OFFSET | HEX | 13'h0000 to 13'h1fff | 13'h0080 | Specifies the amount of data contents in the RAM to trigger the ALMOST_FULL flag. |
| DATA_WIDTH | DECIMAL | 4, 9, 18, 36 | 4 | Specifies the desired data width for the FIFO. Note If set to 36, FIFO_MODE must be set to FIFO18_36. |
| DO_REG | DECIMAL | 1, 0 | 1 | Data pipeline register for EN_SYN. |
| EN_SYN | BOOLEAN | FALSE, TRUE | FALSE | EN_SYN denotes whether the FIFO is operating in either dual-clock (two independent clocks) or synchronous (a |

| Attribute | Type | Allowed Values | Default | Description |
|-------------------------|---------|--------------------------|-------------|--|
| | | | | single clock) mode. Dual-clock must use DO_REG=1. |
| FIFO_MODE | STRING | "FIFO18", "FIFO18_36" | "FIFO18" | Selects "FIFO18" or "FIFO18_36" mode. If set to "FIFO18_36", DATA_WIDTH must be set to 36. |
| FIRST_WORD_FALL_THROUGH | BOOLEAN | FALSE, TRUE | FALSE | If TRUE, the first write to the FIFO will appear on DO without a first RDEN assertion. |
| INIT | HEX | 36 bit HEX | All zeros | Specifies the initial value on the DO output after configuration. |
| SIM_DEVICE | STRING | "7SERIES" | ""7SERIES"" | Must be set to "7SERIES" in order to exhibit proper simulation behavior under all conditions. |
| SRVAL | HEX | 36 bit HEX | All zeros | Specifies the output value of the FIFO upon assertion of the synchronous reset (RSTREG) signal. Only valid for DO_REG=1. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```

FIFO36E1

Primitive: 36Kb FIFO (First-In-First-Out) Block RAM Memory

Introduction

7 series devices contain several block RAM memories that can be configured as FIFOs, automatic error-correction RAM, or general-purpose 36Kb or 18Kb RAM/ROM memories. These Block RAM memories offer fast and flexible storage of large amounts of on-chip data. The FIFO36E1 allows access to the Block RAM in the 36Kb FIFO configurations. This component can be configured and used as a 4-bit wide by 8K deep, 9-bit by 4K deep, 18-bit by 2K deep, 36-bit wide by 1K deep, or 72-bit wide by 512 deep synchronous or dual-clock (asynchronous) FIFO RAM with all associated FIFO flags. When using the dual-clock mode with independent clocks, depending on the offset between read and write clock edges, the Empty, Almost Empty, Full and Almost Full flags can deassert one cycle later. Due to the asynchronous nature of the clocks the simulation model only reflects the deassertion latency cycles listed in the User Guide.

Note For a 72-bit wide by 512 deep FIFO, the "FIFO36_72" mode must be used. For smaller configurations of the FIFO, the FIFO18E1 can be used. If error-correction circuitry is desired, the "FIFO36_72" mode must be used.

Port Descriptions

| Port | Type | Width | Function |
|-------------|--------|-------|---|
| ALMOSTEMPTY | Output | 1 | Programmable flag to indicate the FIFO is almost empty. The ALMOST_EMPTY_OFFSET attribute specifies where to trigger this flag. |
| ALMOSTFULL | Output | 1 | Programmable flag to indicate the FIFO is almost full. The ALMOST_FULL_OFFSET attribute specifies where to trigger this flag. |
| DBITERR | Output | 1 | Status output from ECC function to indicate a double bit error was detected. EN_ECC_READ needs to be TRUE in order to use this functionality. |

| Port | Type | Width | Function |
|----------------|--------|-------|---|
| DI<63:0> | Input | 64 | FIFO data input bus. |
| DIP<7:0> | Input | 8 | FIFO parity data input bus. |
| DO<63:0> | Output | 64 | FIFO data output bus. |
| DOP<7:0> | Output | 8 | FIFO parity data output bus. |
| ECCPARITY<7:0> | Output | 8 | 8-bit data generated by the ECC encoder used by the ECC decoder for memory error detection and correction. |
| EMPTY | Output | 1 | Active high logic to indicate that the FIFO is currently empty. |
| FULL | Output | 1 | Active high logic indicates that the FIFO is full. |
| INJECTDBITERR | Input | 1 | Inject a double bit error if ECC feature is used. |
| INJECTSBITERR | Input | 1 | Inject a single bit error if ECC feature is used. |
| RDCLK | Input | 1 | Rising edge read clock. |
| RDCOUNT<12:0> | Output | 13 | Read count. |
| RDEN | Input | 1 | Active high FIFO read enable. |
| RDERR | Output | 1 | Read error occurred. |
| REGCE | Input | 1 | Output register clock enable for pipelined synchronous FIFO. DO_REG must be 1 to use this enable. |
| RST | Input | 1 | Active high (FIFO logic) asynchronous reset (for dual-clock FIFO), synchronous reset (synchronous FIFO) for 5 CLK cycles. |
| RSTREG | Input | 1 | Output register synchronous set/reset. DO_REG must be 1 to use this reset. |
| SBITERR | Output | 1 | Status output from ECC function to indicate a single bit error was detected. EN_ECC_READ needs to be TRUE in order to use this functionality. |
| WRCLK | Input | 1 | Write clock and enable input signals |
| WRCOUNT<12:0> | Output | 13 | Write count. |
| WREN | Input | 1 | Active high FIFO write enable. |
| WRERR | Output | 1 | Write error occurred. When the FIFO is full, any additional write operation generates an error flag. Synchronous with WRCLK. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | Recommended |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|-------------------------|---------|--------------------------|-------------|--|
| ALMOST_EMPTY_OFFSET | HEX | 13'h0000 to 13'h1fff | 13'h0080 | Specifies the amount of data contents in the RAM to trigger the ALMOST_EMPTY flag. |
| ALMOST_FULL_OFFSET | HEX | 13'h0000 to 13'h1fff | 13'h0080 | Specifies the amount of data contents in the RAM to trigger the ALMOST_FULL flag. |
| DATA_WIDTH | DECIMAL | 4, 9, 18, 36, 72 | 4 | Specifies the desired data width for the FIFO. For data widths of 72, FIFO_MODE must be set to "FIFO36_72" |
| DO_REG | DECIMAL | 1, 0 | 1 | Enable output register to the FIFO for improved clock-to-out timing at the expense of added read latency (one pipeline delay). DO_REG must be 1 when EN_SYN is set to FALSE. |
| EN_ECC_READ | BOOLEAN | FALSE, TRUE | FALSE | Enable the ECC decoder circuitry. |
| EN_ECC_WRITE | BOOLEAN | FALSE, TRUE | FALSE | Enable the ECC encoder circuitry. |
| EN_SYN | BOOLEAN | FALSE, TRUE | FALSE | When FALSE, specifies the FIFO to be used in asynchronous mode (two independent clock) or when TRUE in synchronous (a single clock) operation. |
| FIFO_MODE | STRING | "FIFO36", "FIFO36_72" | "FIFO36" | Selects regular "FIFO36" or the wide "FIFO36_72" mode. If set to "FIFO36_72", the DATA_WIDTH attribute has to be 72. |
| FIRST_WORD_FALL_THROUGH | BOOLEAN | FALSE, TRUE | FALSE | If TRUE, the first write to the FIFO will appear on DO without an RDEN assertion. |
| INIT | HEX | 72 bit HEX | All zeros | Specifies the initial value on the DO output after configuration. |
| SIM_DEVICE | STRING | "7SERIES" | ""7SERIES"" | Must be set to "7SERIES" in order to exhibit proper simulation behavior under all conditions. |
| SRVAL | HEX | 72 bit HEX | All zeros | Specifies the output value of the FIFO upon assertion of the synchronous reset (RSTREG) signal. Only valid for DO_REG=1. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;
```

```

FRAME_ECCE2

Primitive: Configuration Frame Error Correction

Introduction

This design element enables the dedicated, built-in Error Correction Code (ECC) for the configuration memory of the FPGA. This element contains outputs that allow monitoring of the status of the ECC circuitry and the status of the readback CRC circuitry.

Port Descriptions

| Port | Type | Width | Function |
|----------------|--------|-------|--|
| CRCERROR | Output | 1 | Output indicating a CRC error. |
| ECCERROR | Output | 1 | Output indicating an ECC error. |
| ECCERRORSINGLE | Output | 1 | Output Indicating single-bit Frame ECC error detected. |
| FAR<25:0> | Output | 26 | Frame Address Register Value output. |
| SYNBIT<4:0> | Output | 5 | Output bit address of error. |
| SYNDROME<12:0> | Output | 13 | Output location of erroneous bit. |
| SYNDROMEVALID | Output | 1 | Frame ECC output indicating the SYNDROME output is valid. |
| SYNWORD<6:0> | Output | 7 | Word output in the frame where an ECC error has been detected. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|-----------------------|--------|--|---------|--|
| FARSRC | STRING | "EFAR", "FAR" | "EFAR" | Determines if the output of FAR[25:0] configuration register points to the FAR or EFAR. Sets configuration option register bit CTL0[7]. |
| FRAME_RBT_IN_FILENAME | STRING | String representing file name and location | None | This file is output by the ICAP_E2 model and it contains Frame Data information for the Raw Bitstream (RBT) file. The FRAME_ECCE2 model will parse this file, calculate ECC and output any error conditions. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- FRAME_ECCE2: Configuration Frame Error Correction

IBUF

Primitive: Input Buffer

Introduction

This design element is automatically inserted (inferred) by the synthesis tool to any signal directly connected to a top-level input or in-out port of the design. You should generally let the synthesis tool infer this buffer. However, it can be instantiated into the design if required. In order to do so, connect the input port (I) directly to the associated top-level input or in-out port, and connect the output port (O) to the logic sourced by that port. Modify any necessary generic maps (VHDL) or named parameter value assignment (Verilog) in order to change the default behavior of the component.

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|---------------|
| O | Output | 1 | Buffer output |
| I | Input | 1 | Buffer input |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

In general, this element is inferred by the synthesis tool for any specified top-level input port to the design. It is generally not necessary to specify them in the source code. However, if desired, they be manually instantiated by either copying the instantiation code from the appropriate Libraries Guide HDL template and pasting it into the top-level entity/module of your code. It is recommended to always put all I/O components on the top-level of the design to help facilitate hierarchical design methods. Connect the I port directly to the top-level input port of the design and the O port to the logic in which this input is to source. Specify the desired generic/default values in order to configure the proper behavior of the buffer.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|--------------|-----------|-----------------|-----------|--|
| IBUF_LOW_PWR | Boolean | TRUE, FALSE | TRUE | When set to TRUE, allows for reduced power when using differential or referenced (requiring V_{REF}) input standards like LVDS or HSTL. A setting of FALSE demands more power but delivers higher performance characteristics. Consult the 7 Series FPGA SelectIO Resources User Guide for details. |
| IOSTANDARD | String | See Data Sheet. | "DEFAULT" | Assigns an I/O standard to the element. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- IBUF: Single-ended Input Buffer
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

IBUF_inst : IBUF
generic map (
    IBUF_LOW_PWR => TRUE, -- Low power (TRUE) vs. performance (FALSE) setting for referenced I/O standards
    IOSTANDARD => "DEFAULT")
port map (
    O => O,      -- Buffer output
    I => I      -- Buffer input (connect directly to top-level port)
);

-- End of IBUF_inst instantiation
```

Verilog Instantiation Template

```
// IBUF: Single-ended Input Buffer
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

IBUF #(
    .IBUF_LOW_PWR("TRUE"), // Low power (TRUE) vs. performance (FALSE) setting for referenced I/O standards
    .IOSTANDARD("DEFAULT") // Specify the input I/O standard
) IBUF_inst (
    .O(O), // Buffer output
    .I(I)  // Buffer input (connect directly to top-level port)
);

// End of IBUF_inst instantiation
```

For More Information

IBUF_IBUFDISABLE

Primitive: Single-ended Input Buffer with Input Disable

Introduction

This design element is an input buffer used to connect internal logic to an external pin. This element includes an input path disable as an additional power saving feature when the I/O is not used for a sustained amount of time.

Port Descriptions

| Port | Direction | Width | Function |
|-------------|-----------|-------|---|
| I | Input | 1 | Input port connection. Connect directly to top-level port in the design. |
| IBUFDISABLE | Input | 1 | Disables input path through the buffer and forces to a logic high when USE_IBUFDISABLE is set to "TRUE" and this signal is asserted high. If USE_IBUFDISABLE is set to "FALSE" this input is ignored and should be tied to ground. This feature is generally used to reduce power at times when the I/O is idle for a period of time. |
| O | Output | 1 | Buffer output representing the input path to the device. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------------|-----------|--------------------|-----------|--|
| IBUF_LOW_PWR | String | "TRUE", "FALSE" | "TRUE" | Allows a trade off of lower power consumption versus highest performance when referenced I/O standards are used. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| USE_IBUFDISABLE | String | "TRUE", "FALSE" | "TRUE" | Enables or disables the feature of IBUFDISABLE. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- IBUF_IBUFDISABLE: Single-ended Input Buffer with Disable
--                               7 Series
-- Xilinx HDL Libraries Guide, version 14.7

IBUF_IBUFDISABLE_inst : IBUF_IBUFDISABLE
generic map (
  IBUF_LOW_PWR => "TRUE", -- Low power (TRUE) vs. performance (FALSE) setting for referenced I/O standards
  IOSTANDARD => "DEFAULT", -- Specify the input I/O standard
  USE_IBUFDISABLE => "TRUE") -- Set to "TRUE" to enable IBUFDISABLE feature
port map (
  O => O,      -- Buffer output
  I => I,      -- Buffer input (connect directly to top-level port)
  IBUFDISABLE => IBUFDISABLE -- Buffer disable input, low=disable
);

-- End of IBUF_IBUFDISABLE_inst instantiation
```

Verilog Instantiation Template

```
// IBUF_IBUFDISABLE: Single-ended Input Buffer with Disable
//                               7 Series
// Xilinx HDL Libraries Guide, version 14.7

IBUF_IBUFDISABLE #(
  .IBUF_LOW_PWR("TRUE"), // Low power ("TRUE") vs. performance ("FALSE") for referenced I/O standards
  .IOSTANDARD("DEFAULT"), // Specify the input I/O standard
  .USE_IBUFDISABLE("TRUE") // Set to "TRUE" to enable IBUFDISABLE feature
) IBUF_IBUFDISABLE_inst (
  .O(O), // Buffer output
  .I(I), // Buffer input (connect directly to top-level port)
  .IBUFDISABLE(IBUFDISABLE) // Buffer disable input, low=disable
);

// End of IBUF_IBUFDISABLE_inst instantiation
```

IBUF_INTERMDISABLE

Primitive: Single-ended Input Buffer with Input Termination Disable and Input Disable

Introduction

This design element is an input buffer used to connect internal logic to an external pin. This element includes an input termination (INTERM) enable/disable as well as an input path disable as additional power saving features when the I/O is not being used for a sustained amount of time.

Port Descriptions

| Port | Direction | Width | Function |
|---------------|-----------|-------|---|
| I | Input | 1 | Input port connection. Connect directly to top-level port in the design. |
| IBUFDISABLE | Input | 1 | Disables input path through the buffer and forces to a logic high when USE_IBUFDISABLE is set to "TRUE" and this signal is asserted high. If USE_IBUFDISABLE is set to "FALSE" this input is ignored and should be tied to ground. This feature is generally used to reduce power at times when the I/O is idle for a period of time. |
| INTERMDISABLE | Input | 1 | Disables input termination. This feature is generally used to reduce power at times when the I/O is idle. |
| O | Output | 1 | Buffer output representing the input path to the device. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------------|-----------|--------------------|-----------|---|
| IBUF_LOW_PWR | String | "TRUE", "FALSE" | "TRUE" | Allows a trade off of lower power consumption vs. highest performance when referenced I/O standards are used. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| USE_IBUFDISABLE | String | "TRUE", "FALSE" | "TRUE" | Enables or disables the feature of IBUFDISABLE. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- IBUF_INTERMDISABLE: Single-ended Input Buffer with Termination Input Disable
--                               May only be placed in High Range (HR) Banks
--                               7 Series
-- Xilinx HDL Libraries Guide, version 14.7

IBUF_INTERMDISABLE_inst : IBUF_INTERMDISABLE
generic map (
  IBUF_LOW_PWR => "TRUE", -- Low power (TRUE) vs. performance (FALSE) setting for referenced I/O standards
  IOSTANDARD => "DEFAULT", -- Specify the input I/O standard
  USE_IBUFDISABLE => "TRUE") -- Set to "TRUE" to enable IBUFDISABLE feature
port map (
  O => O,      -- Buffer output
  I => I,      -- Buffer input (connect directly to top-level port)
  INTERMDISABLE => INTERMDISABLE, -- Input Termination Disable
  IBUFDISABLE => IBUFDISABLE -- Buffer disable input, low=disable
);

-- End of IBUF_INTERMDISABLE_inst instantiation
```

Verilog Instantiation Template

```
// IBUF_INTERMDISABLE: Single-ended Input Buffer with Termination Input Disable
//                               May only be placed in High Range (HR) Banks

IBUFDS

Primitive: Differential Signaling Input Buffer

Introduction

This design element is an input buffer that supports low-voltage, differential signaling. In IBUFDS, a design level interface signal is represented as two distinct ports (I and IB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET_P and MYNET_N). Optionally, a programmable differential termination feature is available to help improve signal integrity and reduce external components.

Logic Table

| Inputs | | Outputs |
|--------|----|-----------|
| I | IB | O |
| 0 | 0 | No Change |
| 0 | 1 | 0 |
| 1 | 0 | 1 |
| 1 | 1 | No Change |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|---------------------|
| I | Input | 1 | Diff_p Buffer Input |
| IB | Input | 1 | Diff_n Buffer Input |
| O | Output | 1 | Buffer Output |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Put all I/O components on the top-level of the design to help facilitate hierarchical design methods. Connect the I port directly to the top-level "master" input port of the design, the IB port to the top-level "slave" input port, and the O port to the logic in which this input is to source. Specify the desired generic/defparam values in order to configure the proper behavior of the buffer.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|--------------|-----------|-----------------|-----------|--|
| DIFF_TERM | Boolean | TRUE, FALSE | FALSE | The differential termination attribute is designed for the 7 Series FPGA supported differential input I/O standards. It is used to turn the built-in differential termination on (TRUE) or off (FALSE). |
| IBUF_LOW_PWR | Boolean | TRUE, FALSE | TRUE | When set to TRUE, allows for reduced power when using differential or referenced (requiring V_{REF}) input standards like LVDS or HSTL. A setting of FALSE demands more power but delivers higher performance characteristics. Consult the 7 Series FPGA SelectIO Resources User Guide for details. |
| IOSTANDARD | String | See Data Sheet. | "DEFAULT" | Assigns an I/O standard to the element. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- IBUFDS: Differential Input Buffer
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

IBUFDS_inst : IBUFDS
generic map (
    DIFF_TERM => FALSE, -- Differential Termination
    IBUF_LOW_PWR => TRUE, -- Low power (TRUE) vs. performance (FALSE) setting for referenced I/O standards
    IOSTANDARD => "DEFAULT")
port map (
    O => O, -- Buffer output
    I => I, -- Diff_p buffer input (connect directly to top-level port)
    IB => IB -- Diff_n buffer input (connect directly to top-level port)
);

-- End of IBUFDS_inst instantiation
```

Verilog Instantiation Template

```
// IBUFDS: Differential Input Buffer
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

IBUFDS #(
    .DIFF_TERM("FALSE"), // Differential Termination
    .IBUF_LOW_PWR("TRUE"), // Low power="TRUE", Highest performance="FALSE"
    .IOSTANDARD("DEFAULT") // Specify the input I/O standard
) IBUFDS_inst (
    .O(O), // Buffer output
    .I(I), // Diff_p buffer input (connect directly to top-level port)
    .IB(IB) // Diff_n buffer input (connect directly to top-level port)
);

// End of IBUFDS_inst instantiation
```

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

IBUFDS_DIFF_OUT

Primitive: Differential Signaling Input Buffer With Differential Output

X10107

Introduction

This design element is an input buffer that supports differential signaling. In IBUFDS_DIFF_OUT, a design level interface signal is represented as two distinct ports (I and IB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET_P and MYNET_N). The IBUFDS_DIFF_OUT differs from the IBUFDS in that it allows internal access to both phases of the differential signal. Optionally, a programmable differential termination feature is available to help improve signal integrity and reduce external components.

Logic Table

| Inputs | | Outputs | |
|--------|----|-----------|-----------|
| I | IB | O | OB |
| 0 | 0 | No Change | No Change |
| 0 | 1 | 0 | 1 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | No Change | No Change |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| I | Input | 1 | Diff_p Buffer Input (connect to top-level port in the design). |
| IB | Input | 1 | Diff_n Buffer Input (connect to top-level port in the design). |
| O | Output | 1 | Diff_p Buffer Output. |
| OB | Output | 1 | Diff_n Buffer Output. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

It is suggested to put all I/O components on the top-level of the design to help facilitate hierarchical design methods. Connect the I port directly to the top-level "master" input port of the design, the IB port to the top-level "slave" input port, and the O and OB ports to the logic in which this input is to source. Specify the desired generic/parameter values in order to configure the proper behavior of the buffer.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|--------------|-----------|-----------------|-----------|--|
| DIFF_TERM | Boolean | TRUE, FALSE | FALSE | The differential termination attribute is designed for the 7 Series FPGA supported differential input I/O standards. It is used to turn the built-in differential termination on (TRUE) or off (FALSE). |
| IBUF_LOW_PWR | Boolean | TRUE, FALSE | TRUE | When set to TRUE, allows for reduced power when using differential or referenced (requiring V_{REF}) input standards like LVDS or HSTL. A setting of FALSE demands more power but delivers higher performance characteristics. Consult the 7 Series FPGA SelectIO Resources User Guide for details. |
| IOSTANDARD | String | See Data Sheet. | "DEFAULT" | Assigns an I/O standard to the element. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- IBUFDS_DIFF_OUT: Differential Input Buffer with Differential Output
--                               7 Series
-- Xilinx HDL Libraries Guide, version 14.7

IBUFDS_DIFF_OUT_inst : IBUFDS_DIFF_OUT
generic map (
    DIFF_TERM => FALSE, -- Differential Termination
    IBUF_LOW_PWR => TRUE, -- Low power (TRUE) vs. performance (FALSE) setting for referenced I/O standards
    IOSTANDARD => "DEFAULT", -- Specify the input I/O standard
    USE_IBUFDISABLE => "TRUE"
port map (
    O => O, -- Buffer diff_p output
    OB => OB, -- Buffer diff_n output
    I => I, -- Diff_p buffer input (connect directly to top-level port)
    IB => IB -- Diff_n buffer input (connect directly to top-level port)
);

-- End of IBUFDS_DIFF_OUT_inst instantiation
```

Verilog Instantiation Template

```
// IBUFDS_DIFF_OUT: Differential Input Buffer with Differential Output
//                               7 Series
// Xilinx HDL Libraries Guide, version 14.7

IBUFDS_DIFF_OUT #(
    .DIFF_TERM("FALSE"), // Differential Termination, "TRUE"/"FALSE"

IBUFDS_DIFF_OUT_IBUFDISABLE

Primitive: Input Differential Buffer with Input Disable and Differential Output

Introduction

This design element is a differential input buffer used to connect internal logic to an external bidirectional pin. This element includes an input path disable as an additional power saving feature when the input is idle for a sustained time. The IOBUFDS_DIFF_OUT_IBUFDISABLE differs from the IOBUFDS_IBUFDISABLE in that it allows internal access to both phases of the differential signal.

Port Descriptions

| Port | Direction | Width | Function |
|-------------|-----------|-------|---|
| I | Input | 1 | Input p-side port connection. Connect directly to top-level port in the design. |
| IB | Input | 1 | Input n-side port connection. Connect directly to top-level port in the design. |
| IBUFDISABLE | Input | 1 | Disables input path through the buffer and forces to a logic high when USE_IBUFDISABLE is set to "TRUE" and this signal is asserted high. If USE_IBUFDISABLE is set to "FALSE" this input is ignored and should be tied to ground. This feature is generally used to reduce power at times when the I/O is idle for a period of time. |
| O | Output | 1 | Buffer p-side output representing the input path to the device. |
| OB | Output | 1 | Buffer n-side output representing the input path to the device. |

IBUFDS_DIFF_OUT_INTERMDISABLE

Primitive: Input Differential Buffer with Input Termination Disable, Input Disable, and Differential Output

Introduction

This design element is a differential input buffer used to connect internal logic to an external bidirectional pin. This element includes an uncalibrated input termination (INTERM) disable as well as input path disable as additional power saving features when the I/O is idle for a sustained time. The IOBUFDS_DIFF_OUT_INTERMDISABLE differs from the IOBUFDS_INTERMDISABLE in that it allows internal access to both phases of the differential signal. This element may only be placed in High Range (HR) banks in the 7 series devices.

Port Descriptions

| Port | Direction | Width | Function |
|---------------|-----------|-------|--|
| I | Input | 1 | Input p-side port connection. Connect directly to top-level port in the design. |
| IB | Input | 1 | Input n-side port connection. Connect directly to top-level port in the design. |
| IBUFDISABLE | Input | 1 | Disables input path through the buffer and forces to a logic high when USE_IBUFDISABLE is set to "TRUE" and this signal is asserted high. If USE_IBUFDISABLE is set to "FALSE" this input is ignored and should be tied to ground. This feature is generally used to reduce power at times when the I/O is idle. |
| INTERMDISABLE | Input | 1 | Disables input termination. This feature is generally used to reduce power at times when the I/O is idle. |
| O | Output | 1 | Buffer p-side output representing the input path to the device. |
| OB | Output | 1 | Buffer n-side output representing the input path to the device. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------------|-----------|--------------------|-----------|---|
| DIFF_TERM | String | "TRUE", "FALSE" | "FALSE" | Enable the built-in differential termination. |
| IBUF_LOW_PWR | String | "TRUE", "FALSE" | "TRUE" | Allows a trade off of lower power consumption vs. highest performance when referenced I/O standards are used. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| USE_IBUFDISABLE | String | "TRUE", "FALSE" | "TRUE" | Enables or disables the feature of IBUFDISABLE. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- IBUFDS_DIFF_OUT_INTERMDISABLE: Differential Input Buffer with Differential Output w/ Disable
--                               7 Series
-- Xilinx HDL Libraries Guide, version 14.7

IBUFDS_DIFF_OUT_INTERMDISABLE_inst : IBUFDS_DIFF_OUT_INTERMDISABLE
generic map (
  DIFF_TERM => "FALSE", -- Differential Termination
  IBUF_LOW_PWR => "TRUE", -- Low power "TRUE" vs. performance "FALSE" setting for referenced I/O standards

IBUFDS_GTE2

Primitive: Gigabit Transceiver Buffer

Introduction

IBUFDS_GTE2 is the gigabit transceiver input pad buffer component in 7 series devices. The REFCLK signal should be routed to the dedicated reference clock input pins on the serial transceiver, and you should instantiate the IBUFDS_GTE2 primitive in your design. See the 7 series FPGAs Transceivers User Guide for more information on PCB layout requirements, including reference clock requirements.

Design Entry Method

IBUFDS_IBUFDISABLE

Primitive: Input Differential Buffer with Input Path Disable

Introduction

This design element is an input differential buffer used to connect internal logic to an external bidirectional pin. This element includes an input path disable as an additional power saving feature when the I/O is either in an unused state for a sustained amount of time.

Port Descriptions

| Port | Direction | Width | Function |
|-------------|-----------|-------|--|
| I | Input | 1 | Input p-side port connection. Connect directly to top-level port in the design. |
| IB | Input | 1 | Input n-side port connection. Connect directly to top-level port in the design. |
| IBUFDISABLE | Input | 1 | Disables input path through the buffer and forces to a logic high when USE_IBUFDISABLE is set to "TRUE" and this signal is asserted high. If USE_IBUFDISABLE is set to "FALSE" this input is ignored and should be tied to ground. This feature is generally used to reduce power at times when the I/O is idle. |
| O | Output | 1 | Buffer output representing the input path to the device. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Put all I/O components on the top-level of the design to help facilitate hierarchical design methods. Connect the I port directly to the top-level "master" input port of the design, the IB port to the top-level "slave" input port, and the O port to the logic in which this input is to source. Specify the desired generic/defparam values in order to configure the proper behavior of the buffer.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------------|-----------|--------------------|-----------|---|
| DIFF_TERM | String | "TRUE", "FALSE" | "FALSE" | Enable the built-in differential termination. |
| IBUF_LOW_PWR | String | "TRUE", "FALSE" | "TRUE" | Allows a trade off of lower power consumption vs. highest performance when referenced I/O standards are used. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| USE_IBUFDISABLE | String | "TRUE", "FALSE" | "TRUE" | Enables or disables the feature of IBUFDISABLE. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- IBUFDS_IBUFDISABLE: Differential Input Buffer w/ Disable
--                               7 Series
-- Xilinx HDL Libraries Guide, version 14.7

IBUFDS_IBUFDISABLE_inst : IBUFDS_IBUFDISABLE
generic map (
  DIFF_TERM => "FALSE", -- Differential Termination
  IBUF_LOW_PWR => "TRUE", -- Low power (TRUE) vs. performance (FALSE) setting for referenced I/O standards
  IOSTANDARD => "DEFAULT" -- Specify the input I/O standard
  USE_IBUFDISABLE => "TRUE") -- Set to "TRUE" to enable IBUFDISABLE feature
port map (
  O => O, -- Buffer output
  I => I, -- Diff_p buffer input (connect directly to top-level port)
  IB => IB, -- Diff_n buffer input (connect directly to top-level port)
  IBUFDISABLE => IBUFDISABLE -- Buffer disable input, low=disable
);

-- End of IBUFDS_IBUFDISABLE_inst instantiation
```

Verilog Instantiation Template

```
// IBUFDS_IBUFDISABLE: Differential Input Buffer with Input Disable
//                               7 Series
// Xilinx HDL Libraries Guide, version 14.7

IBUFDS_IBUFDISABLE #(
  .DIFF_TERM("FALSE"), // Differential Termination
  .IBUF_LOW_PWR("TRUE"), // Low power="TRUE", Highest performance="FALSE"
  .IOSTANDARD("DEFAULT"), // Specify the input I/O standard
  .USE_IBUFDISABLE("TRUE") // Set to "TRUE" to enable IBUFDISABLE feature
) IBUFDS_IBUFDISABLE_inst (
  .O(O), // Buffer output
  .I(I), // Diff_p buffer input (connect directly to top-level port)
  .IB(IB), // Diff_n buffer input (connect directly to top-level port)
  .IBUFDISABLE(IBUFDISABLE) // Buffer disable input, low=disable
);

// End of IBUFDS_IBUFDISABLE_inst instantiation
```

IBUFDS_INTERMDISABLE

Primitive: Input Differential Buffer with Input Termination Disable and Input Disable

Introduction

This design element is an input differential buffer used to connect internal logic to an external bidirectional pin. This element includes an uncalibrated input termination (INTERM) disable as well as input path disable as additional power saving features when the input is idle for a sustained amount of time. This element may only be placed in High Range (HR) banks in the 7 series devices.

Port Descriptions

| Port | Direction | Width | Function |
|---------------|-----------|-------|--|
| I | Input | 1 | Input p-side port connection. Connect directly to top-level port in the design. |
| IB | Input | 1 | Input n-side port connection. Connect directly to top-level port in the design. |
| IBUFDISABLE | Input | 1 | Disables input path through the buffer and forces to a logic high when USE_IBUFDISABLE is set to "TRUE" and this signal is asserted high. If USE_IBUFDISABLE is set to "FALSE" this input is ignored and should be tied to ground. This feature is generally used to reduce power at times when the I/O is idle. |
| INTERMDISABLE | Input | 1 | Disables input termination. This feature is generally used to reduce power at times when the I/O is idle. |
| O | Output | 1 | Buffer output representing the input path to the device. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------------|-----------|--------------------|-----------|---|
| DIFF_TERM | String | "TRUE", "FALSE" | "FALSE" | Enable the built-in differential termination. |
| IBUF_LOW_PWR | String | "TRUE", "FALSE" | "TRUE" | Allows a trade off of lower power consumption versus. highest performance when referenced I/O standards are used. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| USE_IBUFDISABLE | String | "TRUE", "FALSE" | "TRUE" | Enables or disables the IBUFDISABLE feature. Generally used when it is not desirable to disable the input path in order to allow a read during write operation. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- IBUFDS_INTERMDISABLE: Differential Input Buffer with Input Termination Disable
--                               May only be placed in High Range (HR) Banks
--                               7 Series
-- Xilinx HDL Libraries Guide, version 14.7

IBUFDS_INTERMDISABLE_inst : IBUFDS_INTERMDISABLE
generic map (
  DIFF_TERM => "FALSE", -- Differential Termination
  IBUF_LOW_PWR => "TRUE", -- Low power (TRUE) vs. performance (FALSE) setting for referenced I/O standards
  IOSTANDARD => "DEFAULT" -- Specify the input I/O standard
  USE_IBUFDISABLE => "TRUE") -- Set to "TRUE" to enable IBUFDISABLE feature
port map (
  O => O, -- Buffer output
  I => I, -- Diff_p buffer input (connect directly to top-level port)
  IB => IB, -- Diff_n buffer input (connect directly to top-level port)
  IBUFDISABLE => IBUFDISABLE, -- Buffer disable input, low-disable
  INTERMDISABLE => INTERMDISABLE -- Input termination disable
);

-- End of IBUFDS_IBUFDISABLE_inst instantiation
```

Verilog Instantiation Template

```
// IBUFDS_INTERMDISABLE: Differential Input Buffer with Input Termination Disable
//                               May only be placed in High Range (HR) Banks
//                               7 Series
// Xilinx HDL Libraries Guide, version 14.7

IBUFDS_INTERMDISABLE #(
  .DIFF_TERM("FALSE"), // Differential Termination

IBUFG

Primitive: Dedicated Input Clock Buffer

Introduction

The IBUFG is a dedicated input to the FPGA that should be used to connect incoming clocks to global clock routing resources. The IBUFG provides dedicated connections from a top-level port to the Clock Management Tile (which includes an MMCM and PLL) or BUFG, providing the minimum amount of clock delay and jitter to the device. The IBUFG input can only be driven by clock capable pins (MRCC or SRCC pins).

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|----------------------|
| O | Output | 1 | Clock Buffer output. |
| I | Input | 1 | Clock Buffer input. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|--------------|-----------|----------------|-----------|---|
| IBUF_LOW_PWR | Boolean | TRUE, FALSE | TRUE | Select between power and performance: <ul style="list-style-type: none"> TRUE reduces power when using differential or referenced (requiring V_{REF}) input standards like LVDS or HSTL. FALSE demands more power but delivers higher performance. See the 7 Series FPGA SelectIO Resources User Guide for details. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- IBUFG: Single-ended global clock input buffer
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

IBUFG_inst : IBUFG
generic map (
  IBUF_LOW_PWR => TRUE, -- Low power (TRUE) vs. performance (FALSE) setting for referenced I/O standards
  IOSTANDARD => "DEFAULT")
port map (
  O => O, -- Clock buffer output
  I => I -- Clock buffer input (connect directly to top-level port)
);

-- End of IBUFG_inst instantiation
```

Verilog Instantiation Template

```
// IBUFG: Single-ended global clock input buffer
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

IBUFG #(
  .IBUF_LOW_PWR("TRUE"), // Low power="TRUE", Highest performance="FALSE"
  .IOSTANDARD("DEFAULT") // Specify the input I/O standard
) IBUFG_inst (
  .O(O), // Clock buffer output
  .I(I) // Clock buffer input (connect directly to top-level port)
);

// End of IBUFG_inst instantiation
```

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

IBUFGDS

Primitive: Differential Signaling Dedicated Input Clock Buffer

Introduction

This design element is a dedicated differential signaling input buffer for connection to the clock buffer (BUFG) or MMCM. In IBUFGDS, a design-level interface signal is represented as two distinct ports (I and IB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET_P and MYNET_N).

Logic Table

| Inputs | | Outputs |
|--------|----|-----------|
| I | IB | O |
| 0 | 0 | No Change |
| 0 | 1 | 0 |
| 1 | 0 | 1 |
| 1 | 1 | No Change |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|---------------------------|
| O | Output | 1 | Clock Buffer output |
| IB | Input | 1 | Diff_n Clock Buffer Input |
| I | Input | 1 | Diff_p Clock Buffer Input |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Put all I/O components on the top-level of the design to help facilitate hierarchical design methods. Connect the I port directly to the top-level "master" input port of the design, the IB port to the top-level "slave" input port and the O port to an MMCM, BUFG or logic in which this input is to source. Some synthesis tools infer the BUFG automatically if necessary, when connecting an IBUFG to the clock resources of the FPGA. Specify the desired generic/defparam values in order to configure the proper behavior of the buffer.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|--------------|-----------|----------------|-----------|--|
| DIFF_TERM | Boolean | TRUE, FALSE | FALSE | Specifies the use of the internal differential termination resistance. |
| IBUF_LOW_PWR | Boolean | TRUE, FALSE | TRUE | When set to TRUE, allows for reduced power when using differential or referenced (requiring V_{REF}) input standards like LVDS or HSTL. A setting of FALSE demands more power but delivers higher performance characteristics. Consult the 7 Series FPGA SelectIO Resources User Guide for details. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```

Library UNISIM;
use UNISIM.vcomponents.all;

-- IBUFGDS: Differential Global Clock Input Buffer
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

IBUFGDS_inst : IBUFGDS
generic map (
  DIFF_TERM => FALSE, -- Differential Termination
  IBUF_LOW_PWR => TRUE, -- Low power (TRUE) vs. performance (FALSE) setting for referenced I/O standards
  IOSTANDARD => "DEFAULT")
port map (
  O => O, -- Clock buffer output
  I => I, -- Diff_p clock buffer input (connect directly to top-level port)
  IB => IB -- Diff_n clock buffer input (connect directly to top-level port)
);

-- End of IBUFGDS_inst instantiation

```

Verilog Instantiation Template

```

// IBUFGDS: Differential Global Clock Input Buffer
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

IBUFGDS #(
  .DIFF_TERM("FALSE"), // Differential Termination
  .IBUF_LOW_PWR("TRUE"), // Low power="TRUE", Highest performance="FALSE"
  .IOSTANDARD("DEFAULT") // Specify the input I/O standard
) IBUFGDS_inst (
  .O(O), // Clock buffer output
  .I(I), // Diff_p clock buffer input (connect directly to top-level port)
  .IB(IB) // Diff_n clock buffer input (connect directly to top-level port)
);

// End of IBUFGDS_inst instantiation

```

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

IBUFGDS_DIFF_OUT

Primitive: Differential Signaling Dedicated Input Clock Buffer with Differential Output

Introduction

This design element is an input buffer that supports differential signaling. In IBUFGDS_DIFF_OUT, a design level interface signal is represented as two distinct ports (I and IB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET_P and MYNET_N). The IBUFGDS_DIFF_OUT differs from the IBUFGDS in that it allows internal access to both phases of the differential signal. Optionally, a programmable differential termination feature is available to help improve signal integrity and reduce external components.

Logic Table

| Inputs | | Outputs | |
|--------|----|-----------|-----------|
| I | IB | O | OB |
| 0 | 0 | No Change | No Change |
| 0 | 1 | 0 | 1 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | No Change | No Change |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| I | Input | 1 | Diff_p Buffer Input (connect to top-level port in the design). |
| IB | Input | 1 | Diff_n Buffer Input (connect to top-level port in the design). |
| O | Output | 1 | Diff_p Buffer Output. |
| OB | Output | 1 | Diff_n Buffer Output. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Xilinx suggests that you put all I/O components on the top-level of the design to help facilitate hierarchical design methods. Connect the I port directly to the top-level "master" input port of the design, the IB port to the top-level "slave" input port, and the O and OB ports to the logic in which this input is to source. Specify the desired generic/parameter values in order to configure the proper behavior of the buffer.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|--------------|-----------|----------------|-----------|--|
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| DIFF_TERM | Boolean | TRUE, FALSE | FALSE | Specifies the use of the internal differential termination resistance. |
| IBUF_LOW_PWR | Boolean | TRUE, FALSE | TRUE | When set to TRUE, allows for reduced power when using differential or referenced (requiring V_{REF}) input standards like LVDS or HSTL. A setting of FALSE demands more power but delivers higher performance characteristics. Consult the 7 Series FPGA SelectIO Resources User Guide for details. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- IBUFGDS_DIFF_OUT: Differential Global Clock Buffer with Differential Output
--                               7 Series
-- Xilinx HDL Libraries Guide, version 14.7

IBUFGDS_DIFF_OUT_inst : IBUFGDS_DIFF_OUT
generic map (
  DIFF_TERM => FALSE, -- Differential Termination
  IBUF_LOW_PWR => TRUE, -- Low power (TRUE) vs. performance (FALSE) setting for referenced I/O standards
  IOSTANDARD => "DEFAULT") -- Specify the input I/O standard
port map (
  O => O, -- Buffer diff_p output
  OB => OB, -- Buffer diff_n output
  I => I, -- Diff_p buffer input (connect directly to top-level port)
  IB => IB -- Diff_n buffer input (connect directly to top-level port)
);

-- End of IBUFGDS_DIFF_OUT_inst instantiation
```

Verilog Instantiation Template

```
// IBUFGDS_DIFF_OUT: Differential Global Clock Buffer with Differential Output
//                               7 Series
// Xilinx HDL Libraries Guide, version 14.7

IBUFGDS_DIFF_OUT #(
  .DIFF_TERM("FALSE"), // Differential Termination, "TRUE"/"FALSE"
  .IBUF_LOW_PWR("TRUE"), // Low power="TRUE", Highest performance="FALSE"
  .IOSTANDARD("DEFAULT") // Specify the input I/O standard
) IBUFGDS_DIFF_OUT_inst (
  .O(O), // Buffer diff_p output
  .OB(OB), // Buffer diff_n output
  .I(I), // Diff_p buffer input (connect directly to top-level port)
  .IB(IB) // Diff_n buffer input (connect directly to top-level port)
);

// End of IBUFGDS_DIFF_OUT_inst instantiation
```

ICAPE2

Primitive: Internal Configuration Access Port

Introduction

This design element gives you access to the configuration functions of the FPGA from the FPGA fabric. Using this component, commands and data can be written to and read from the configuration logic of the FPGA array. Since the improper use of this function can have a negative effect on the functionality and reliability of the FPGA, you should not use this element unless you are very familiar with its capabilities.

Port Descriptions

| Port | Type | Width | Function |
|---------|--------|-------|-------------------------------|
| CLK | Input | 1 | Clock Input |
| CSIB | Input | 1 | Active-Low ICAP Enable |
| I<31:0> | Input | 32 | Configuration data input bus |
| O<31:0> | Output | 32 | Configuration data output bus |
| RDWRB | Input | 1 | Read/Write Select input |

Design Entry Method

IDDR

Primitive: Input Dual Data-Rate Register

Introduction

This design element is a dedicated input register designed to receive external dual data rate (DDR) signals into Xilinx® FPGAs. The IDDR is available with modes that present the data to the FPGA fabric at the time and clock edge they are captured, or on the same clock edge. This feature allows you to avoid additional timing complexities and resource usage.

- **OPPOSITE_EDGE mode** - Data is recovered in the classic DDR methodology. Given a DDR data and clock at pin D and C respectively, Q1 changes after every positive edge of clock C, and Q2 changes after every negative edge of clock C.
- **SAME_EDGE mode** - Data is still recovered by opposite edges of clock C. However, an extra register has been placed behind the negative edge data register. This extra register is clocked with positive clock edge of clock signal C. As a result, DDR data is now presented into the FPGA fabric at the same clock edge. However, because of this feature, the data pair appears to be "separated." Q1 and Q2 no longer have pair 1 and 2. Instead, the first pair presented is Pair 1 and DONT_CARE, followed by Pair 2 and 3 at the next clock cycle.
- **SAME_EDGE_PIPELINED mode** - Recovers data in a similar fashion as the SAME_EDGE mode. In order to avoid the "separated" effect of the SAME_EDGE mode, an extra register has been placed in front of the positive edge data register. A data pair now appears at the Q1 and Q2 pin at the same time. However, using this mode costs you an additional cycle of latency for Q1 and Q2 signals to change.

IDDR also works with the SelectIO™ features, such as the IDELAYE2.

Note For high speed interfaces, the IDDR_2CLK component can be used to specify two independent clocks to capture the data. Use this component when the performance requirements of the IDDR are not adequate, since the IDDR_2CLK requires more clocking resources and can imply placement restrictions that are not necessary when using the IDDR component.

Port Descriptions

| Port | Direction | Width | Function |
|---------|-----------|-------|---|
| Q1 - Q2 | Output | 1 | These pins are the IDDR output that connects to the FPGA fabric. Q1 is the first data pair and Q2 is the second data pair. |
| C | Input | 1 | Clock input pin. |
| CE | Input | 1 | When asserted Low, this port disables the output clock at port O. |
| D | Input | 1 | This pin is where the DDR data is presented into the IDDR module. This pin connects to a top-level input or bi-directional port, an IDELAYE2 configured for an input delay or to an appropriate input or bidirectional buffer. |
| R | Input | 1 | Active high reset forcing Q1 and Q2 to a logic zero. Can be synchronous or asynchronous based on the SRTYPE attribute. |
| S | Input | 1 | Active high reset forcing Q1 and Q2 to a logic one. Can be synchronous or asynchronous based on the SRTYPE attribute. |

Note You cannot have an active set and an active reset in this component. One or both of the signals R and S must be tied to ground.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|--------------|-----------|---|-----------------|---|
| DDR_CLK_EDGE | String | "OPPOSITE_EDGE", "SAME_EDGE", "SAME_EDGE_PIPELINED" | "OPPOSITE_EDGE" | Sets the IDDR mode of operation with respect to clock edge. |
| INIT_Q1 | Binary | 0, 1 | 0 | Initial value on the Q1 pin after configuration startup or when GSR is asserted. |
| INIT_Q2 | Binary | 0, 1 | 0 | Initial value on the Q2 pin after configuration startup or when GSR is asserted. |
| SRTYPE | String | "SYNC" or "ASYN" | "SYNC" | Set/reset type selection. "SYNC" specifies the behavior of the reset (R) and set (S) pins to be synchronous to the positive edge of the C clock pin. "ASYN" specifies an asynchronous set/reset function. |

IDDR_2CLK

Primitive: Input Dual Data-Rate Register with Dual Clock Inputs

Introduction

This design element is a dedicated input register designed to receive external dual data rate (DDR) signals into Xilinx® FPGAs. You should only use the IDDR_2CLK for very high speed interfaces, since it requires more clocking resources, more power, and can imply certain placement restrictions that are not necessary when using the IDDR component. The IDDR component is also easier to use, uses fewer resources, and has fewer restrictions, though it cannot operate at the same high I/O speeds. The IDDR_2CLK is available with modes that present the data to the FPGA fabric at the time and clock edge they are captured, or on the same clock edge. This feature allows designers to avoid additional timing complexities and resource usage.

- **OPPOSITE_EDGE mode** - Data is presented in the classic DDR methodology. Given a DDR data and clock at pin D and C respectively, Q1 changes after every positive edge of clock C, and Q2 changes after every positive edge of clock CB.
- **SAME_EDGE mode** - Data is still presented by positive edges of each clock. However, an extra register has been placed in front of the CB clocked data register. This extra register is clocked with positive clock edge of clock signal C. As a result, DDR data is now presented into the FPGA fabric at the positive edge of clock C. However, because of this feature, the data pair appears to be "separated." Q1 and Q2 no longer have pair 1 and 2. Instead, the first pair presented is Pair 1 and DON'T CARE, followed by Pair 2 and 3 at the next clock cycle.
- **SAME_EDGE_PIPELINED mode** - Presents data in a similar fashion as the SAME_EDGE mode. In order to avoid the "separated" effect of the SAME_EDGE mode, an extra register has been placed in front of the C clocked data register. A data pair now appears at the Q1 and Q2 pin at the same time during the positive edge of C. However, using this mode requires an additional cycle of latency for Q1 and Q2 signals to change.

IDDR also works with SelectIO™ features, such as the IODELAYE2.

Port Descriptions

| Port | Direction | Width | Function |
|---------|-----------|-------|---|
| Q1 : Q2 | Output | 1 | These pins are the IDDR output that connects to the FPGA fabric. Q1 is the first data pair and Q2 is the second data pair. |
| C | Input | 1 | Primary clock input pin used to capture the positive edge data. |
| CB | Input | 1 | Secondary clock input pin (typically 180 degrees out of phase with the primary clock) used to capture the negative edge data. |
| CE | Input | 1 | When asserted Low, this port disables the output clock at port O. |
| D | Input | 1 | This pin is where the DDR data is presented into the IDDR module. This pin connects to a top-level input or bi-directional port, and IODELAY configured for an input delay or to an appropriate input or bidirectional buffer. |

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| R | Input | 1 | Active high reset forcing Q1 and Q2 to a logic zero. Can be synchronous or asynchronous based on the SRTYPE attribute. |
| S | Input | 1 | Active high reset forcing Q1 and Q2 to a logic one. Can be synchronous or asynchronous based on the SRTYPE attribute. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

- Connect the C pin to the appropriate clock source, representing the positive clock edge and CB to the clock source representing the negative clock edge.
- Connect the D pin to the top-level input, or bidirectional port, an IODELAY, or an instantiated input or bidirectional buffer.
- The Q1 and Q2 pins should be connected to the appropriate data sources.
- CE should be tied high when not used, or connected to the appropriate clock enable logic.
- R and S pins should be tied low, if not used, or to the appropriate set or reset generation logic.
- Set all attributes to the component to represent the desired behavior.
- Always instantiate this component in pairs with the same clocking, and to LOC those to the appropriate P and N I/O pair in order not to sacrifice possible I/O resources.
- Always instantiate this component in the top-level hierarchy of your design, along with any other instantiated I/O components for the design. This helps facilitate hierarchical design flows/practices.
- To minimize CLK skew, both CLK and CLKB should come from global routing (MMCM) and not from the local inversion. MMCM de-skews these clocks whereas the local inversion adds skew.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|--------------|-----------|--|-----------------|--|
| DDR_CLK_EDGE | String | "OPPOSITE_EDGE", "SAME_EDGE" "SAME_EDGE_PIPELINED" | "OPPOSITE_EDGE" | DDR clock mode recovery mode selection. See Introduction for more explanation. |
| INIT_Q1 | Binary | 0, 1 | 0 | Initial value on the Q1 pin after configuration startup or when GSR is asserted. |
| INIT_Q2 | Binary | 0, 1 | 0 | Initial value on the Q2 pin after configuration startup or when GSR is asserted. |
| SRTYPE | String | "SYNC" or "ASYNC" | "SYNC" | Set/reset type selection. SYNC specifies the behavior of the reset (R) and set (S) pins to be synchronous to the positive edge of the C clock pin. "ASYNC" specifies an asynchronous set/reset function. |

VHDL Instantiation Template

IDELAYCTRL

Primitive: IDELAYE2/ODELAYE2 Tap Delay Value Control

Introduction

At least one of these design elements must be instantiated when using IDELAYE2 or ODELAYE2. The IDELAYCTRL module provides a reference clock input that allows internal circuitry to derive a voltage bias, independent of PVT (process, voltage, and temperature) variations, in order to define precise delay tap values for the associated IDELAYE2 and ODELAYE2 components. Use the IODELAY_GROUP attribute when instantiating this component to distinguish which IDELAYCTRL is associated with which IDELAYE2 and ODELAYE2. See the ISE Constraint Guide for more details on IODELAY_GROUP.

Port Descriptions

| Port | Type | Width | Function |
|--------|--------|-------|--|
| RDY | Output | 1 | The ready (RDY) signal indicates when the IDELAYE2 and ODELAYE2 modules in the specific region are calibrated. The RDY signal is deasserted if REFCLK is held High or Low for one clock period or more. If RDY is deasserted Low, the IDELAYCTRL module must be reset. If not needed, RDY to be unconnected/ignored. |
| REFCLK | Input | 1 | Time reference to IDELAYCTRL to calibrate all IDELAYE2 and ODELAYE2 modules in the same region. REFCLK can be supplied directly from a user-supplied source or the MMCME2/PLLE2 and must be routed on a global clock buffer. |
| RST | Input | 1 | Active-High asynchronous reset. To ensure proper IDELAYE2 and ODELAYE2 operation, IDELAYCTRL must be reset after configuration and the REFCLK signal is stable. A reset pulse width Tidelayctrl_rpw is required. |

RST (Module reset) - Resets the IDELAYCTRL circuitry. The RST signal is an active-high asynchronous reset. To reset the IDELAYCTRL, assert it High for at least 50 ns.

REFCLK (Reference Clock) - Provides a voltage bias, independent of process, voltage, and temperature variations, to the tap-delay lines in the IOBs. The frequency of REFCLK must be 200 MHz to guarantee the tap-delay value specified in the applicable data sheet.

RDY (Ready Output) - Indicates the validity of the reference clock input, REFCLK. When REFCLK disappears (i.e., REFCLK is held High or Low for one clock period or more), the RDY signal is deasserted.

IDELAYE2

Primitive: Input Fixed or Variable Delay Element

Introduction

Every I/O block contains a programmable absolute delay element called IDELAYE2. The IDELAYE2 can be connected to an input register/ISERDESE1 or driven directly into FPGA logic. The IDELAYE2 is a 31-tap, wraparound, delay element with a calibrated tap resolution. Refer to the 7 series FPGA Data Sheet for delay values. The IDELAYE2 allows incoming signals to be delayed on an individual basis. The tap delay resolution is varied by selecting an IDELAYCTRL reference clock from the range specified in the 7 series FPGA Data Sheet.

Port Descriptions

| Port | Type | Width | Function |
|-------------------|--------|-------|--|
| C | Input | 1 | All control inputs to IDELAYE2 primitive (RST, CE, and INC) are synchronous to the clock input (C). A clock must be connected to this port when IDELAYE2 is configured in "VARIABLE", "VAR_LOAD" or "VAR_LOAD_PIPE" mode. C can be locally inverted, and must be supplied by a global or regional clock buffer. This clock should be connected to the same clock in the SelectIO logic resources (when using ISERDESE2 and OSERDESE2, C is connected to CLKDIV). |
| CE | Input | 1 | Active high enable increment/decrement function |
| CINVCTRL | Input | 1 | The CINVCTRL pin is used for dynamically switching the polarity of C pin. This is for use in applications when glitches are not an issue. When switching the polarity, do not use the IDELAYE2 control pins for two clock cycles. |
| CNTVALUEIN <4:0> | Input | 5 | Counter value from FPGA logic for dynamically loadable tap value input. |
| CNTVALUEOUT <4:0> | Output | 5 | The CNTVALUEOUT pins are used for reporting the dynamically switching value of the delay element. CNTVALUEOUT is only available when IDELAYE2 is in "VAR_LOAD" or "VAR_LOAD_PIPE" mode. |
| DATAIN | Input | 1 | The DATAIN input is directly driven by the FPGA logic providing a logic accessible delay line. The data is driven back into the FPGA logic through the DATAOUT port with a delay set by the IDELAY_VALUE. DATAIN can be locally inverted. The data cannot be driven to an I/O. |
| DATAOUT | Output | 1 | Delayed data from either the IDATAIN or DATAIN input paths. DATAOUT connects to an ISERDESE2, input register or FPGA logic. |
| IDATAIN | Input | 1 | The IDATAIN input is driven by its associated I/O. The data can be driven to either an ISERDESE1 or input register block, directly into the |

| Port | Type | Width | Function |
|----------|-------|-------|--|
| | | | FPGA logic, or to both through the DATAOUT port with a delay set by the IDELAY_VALUE. |
| INC | Input | 1 | Increment/decrement number of tap delays |
| LD | Input | 1 | Load IDELAY_VALUE to the counter. |
| LDPIPEEN | Input | 1 | Enable PIPELINE register to load data from LD pins. |
| REGRST | Input | 1 | When in "VARIABLE" mode, resets the delay element to a value set by the IDELAY_VALUE. If this attribute is not specified, a value of zero is assumed. The RST signal is an active-high reset and is synchronous to the input clock signal (C). When in "VAR_LOAD" or "VAR_LOAD_PIPE" mode, the IDELAYE2 reset signal resets the delay element to a value set by the CNTVALUEIN. The value present at CNTVALUEIN will be the new tap value. As a results of this functionality the IDELAY_VALUE is ignored. |

Design Entry Method

|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|-----------------------|--------|---|-----------|--|
| CINVCTRL_SEL | STRING | "FALSE", "TRUE" | "FALSE" | Enables the CINVCTRL_SEL pin to dynamically switch the polarity of the C pin. |
| DELAY_SRC | STRING | "IDATAIN", "DATAIN" | "IDATAIN" | Select the delay source input to the IDELAYE2 <ul style="list-style-type: none"> "IDATAIN": IDELAYE2 chain input is IDATAIN "DATAIN" : IDELAYE2 chain input is DATAIN |
| HIGH_PERFORMANCE_MODE | STRING | "FALSE", "TRUE" | "FALSE" | When TRUE, this attribute reduces the output jitter. When FALSE, power consumption is reduced. The difference in power consumption is quantified in the Xilinx Power Estimator tool. |
| IDELAY_TYPE | STRING | "FIXED", "VARIABLE", "VAR_LOAD", "VAR_LOAD_PIPE" | "FIXED" | Sets the type of tap delay line. <ul style="list-style-type: none"> "FIXED" - Sets a static delay value. "VARIABLE" - Dynamically adjust (incement/decrement) delay value. "VAR_LOAD" - Dynamically loads tap values. "VAR_LOAD_PIPE" - Pipelined dynamically loadable tap values. |

| Attribute | Type | Allowed Values | Default | Description |
|------------------|---------------------------|--|---------|---|
| IDELAY_VALUE | DECIMAL | 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 | 0 | Specifies the fixed number of delay taps in fixed mode or the initial starting number of taps in "VARIABLE" mode (input path). When IDELAY_TYPE is set to "VAR_LOAD" or "VAR_LOAD_PIPE" mode, this value is ignored. |
| PIPE_SEL | STRING | "FALSE", "TRUE" | "FALSE" | Select pipelined mode. |
| REFCLK_FREQUENCY | 1 significant digit FLOAT | 190.0 to 310.0 | 200.0 | Sets the tap value (in MHz) used by the timing analyzer for static timing analysis and functional/timing simulation. The frequency of REFCLK must be within the given datasheet range to guarantee the tap-delay value and performance. |
| SIGNAL_PATTERN | STRING | "DATA", "CLOCK" | "DATA" | Causes the timing analyzer to account for the appropriate amount of delay-chain jitter in the data or clock path. |

IN_FIFO

Primitive: Input First-In, First-Out (FIFO)

Introduction

The Input FIFO is a new resource located next to the I/O. This dedicated hardware is designed to help transition the data from the input port, input register, IDDR or ISERDES to the fabric. It has two basic modes the first is a 4x4 mode where the data coming into the FIFO goes out at the same rate. The second mode is a 4x8 mode where the data coming out is de-serialized by a factor of 2. In other words in 4x8 mode 4 bits go to the IN_FIFO and 8 bits come out. Features of this component include:

- Array dimensions: 80 wide, 8 deep (4x8 mode); 40 wide, 8 deep (4x4 mode)
- Empty and Full flags
- Programmable Almost Empty and Almost Full flags

Port Descriptions

| Port | Type | Width | Function |
|-------------|--------|-------|---|
| ALMOSTEMPTY | Output | 1 | Active high output flag indicating the FIFO is almost empty. The threshold of the almost empty flag is set by the ALMOST_EMPTY_VALUE attribute. |
| ALMOSTFULL | Output | 1 | Active high output flag indicating the FIFO is almost full. The threshold of the almost empty flag is set by the ALMOST_FULL_VALUE attribute. |
| D0<3:0> | Input | 4 | Channel 0 input bus. |
| D1<3:0> | Input | 4 | Channel 1 input bus. |
| D2<3:0> | Input | 4 | Channel 2 input bus. |
| D3<3:0> | Input | 4 | Channel 3 input bus. |
| D4<3:0> | Input | 4 | Channel 4 input bus. |
| D5<7:0> | Input | 8 | Channel 5 input bus. |
| D6<7:0> | Input | 8 | Channel 6 input bus. |
| D7<3:0> | Input | 4 | Channel 7 input bus. |
| D8<3:0> | Input | 4 | Channel 8 input bus. |
| D9<3:0> | Input | 4 | Channel 9 input bus. |
| EMPTY | Output | 1 | Active high output flag indicating the FIFO is empty. |
| FULL | Output | 1 | Active high output flag indicating the FIFO is full. |
| Q0<7:0> | Output | 8 | Channel 0 output bus. |
| Q1<7:0> | Output | 8 | Channel 1 output bus. |
| Q2<7:0> | Output | 8 | Channel 2 output bus. |
| Q3<7:0> | Output | 8 | Channel 3 output bus. |
| Q4<7:0> | Output | 8 | Channel 4 output bus. |
| Q5<7:0> | Output | 8 | Channel 5 output bus. |
| Q6<7:0> | Output | 8 | Channel 6 output bus. |
| Q7<7:0> | Output | 8 | Channel 7 output bus. |
| Q8<7:0> | Output | 8 | Channel 8 output bus. |
| Q9<7:0> | Output | 8 | Channel 9 output bus. |
| RDCLK | Input | 1 | Read clock. |
| RDEN | Input | 1 | Active high read enable. |
| RESET | Input | 1 | Active high asynchronous reset. |
| WRCLK | Input | 1 | Write clock. |
| WREN | Input | 1 | Active high write enable. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|--------------------|---------|---|--------------------|--|
| ALMOST_EMPTY_VALUE | DECIMAL | 1, 2 | 1 | Specifies the number of entries left before asserting the ALMOSTEMPTY output signal. |
| ALMOST_FULL_VALUE | DECIMAL | 1, 2 | 1 | Specifies the number of entries left before asserting the ALMOSTFULL output signal. |
| ARRAY_MODE | STRING | "ARRAY_MODE_4_X_8", "ARRAY_MODE_4_X_4" | "ARRAY_MODE_4_X_8" | Specifies deserializer mode: <ul style="list-style-type: none"> "ARRAY_MODE_8_X_8" - Eight bits in, eight bits out "ARRAY_MODE_4_X_8" - Four bits in, eight bits out |
| SYNCHRONOUS_MODE | STRING | "FALSE" | "FALSE" | Specify whether the RDCLK and WRCLK are synchronous to each other. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```

IOBUF

Primitive: Bi-Directional Buffer

Introduction

The design element is a bidirectional single-ended I/O Buffer used to connect internal logic to an external bidirectional pin.

Logic Table

| Inputs | | Bidirectional | Outputs |
|--------|---|---------------|---------|
| T | I | IO | O |
| 1 | X | Z | IO |
| 0 | 1 | 1 | 1 |
| 0 | 0 | 0 | 0 |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|----------------------|
| O | Output | 1 | Buffer output |
| IO | In/out | 1 | Buffer In/out |
| I | Input | 1 | Buffer input |
| T | Input | 1 | 3-State enable input |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|------------|-----------|------------------------|-----------|---|
| DRIVE | Integer | 2, 4, 6, 8, 12, 16, 24 | 12 | Selects output drive strength (mA) for the SelectIO™ buffers that use the LVTTTL, LVCMOS12, LVCMOS15, LVCMOS18, LVCMOS25, or LVCMOS33 interface I/O standard. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| SLEW | String | "SLOW", "FAST" | "SLOW" | Sets the output rise and fall time. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

IOBUF_DCIEN

Primitive: Bi-Directional Single-ended Buffer with DCI and Input Disable

Introduction

This design element is a bidirectional single ended I/O buffer used to connect internal logic to an external bidirectional pin. This element includes Digitally Controlled Impedance (DCI) termination enable/disable as well as input path disable as additional power saving features when the I/O is either in an unused state or being used as an output for a sustained amount of time. This element may only be placed in High Performance (HP) banks in the 7 series devices.

Port Descriptions

| Port | Direction | Width | Function |
|----------------|-----------|-------|--|
| IO | In/out | 1 | Bi-directional port connection. Connect directly to top-level port in the design. |
| I | Input | 1 | Buffer input representing the output path to the device. |
| IBUFDISABLE | Input | 1 | Disables input path. When this signal is asserted HIGH and the attribute USE_IBUFDISABLE is set to "TRUE", the input path through the input buffer is disabled and forced to a logic HIGH. If USE_IBUFDISABLE is set to "FALSE" this input is ignored and should be tied to ground. This feature is generally used to reduce power at times when the I/O is either idle or during sustained write (output) conditions. |
| DCITERMDISABLE | Input | 1 | Disables DCI termination. When this signal is asserted HIGH, DCI termination is disabled. This feature is generally used to reduce power at times when the I/O is either idle or during sustained write (output) conditions. |
| T | Input | 1 | Sets the I/O in a high impedance 3-state mode when the I/O is being used for a read (input) operation. The T pin also affects the IBUFDISABLE function when USE_IBUFDISABLE = "TRUE". |
| O | Output | 1 | Buffer output representing the input path to the device. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------------|-----------|------------------------|-----------|---|
| DRIVE | Integer | 2, 4, 6, 8, 12, 16, 24 | 12 | Selects output drive strength (mA) for the SelectIO™ buffers. |
| IBUF_LOW_PWR | String | "TRUE", "FALSE" | "TRUE" | Allows a trade off of lower power consumption vs. highest performance. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| SLEW | String | "SLOW", "FAST", | "SLOW" | Sets the output rise and fall time. See the Data Sheet for recommendations of the best setting for this attribute. |
| USE_IBUFDISABLE | String | "TRUE", "FALSE" | "TRUE" | Enables or disables the feature of IBUFDISABLE. Set to FALSE when it is not desirable to have the T pin disable input path to allow a read during write operation. When set to TRUE deasserting T (IO used as output) or asserting IBUFDISABLE will disable the input path through the buffer and forces to a logic high. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```

Library UNISIM;
use UNISIM.vcomponents.all;

-- IOBUF_DCIEN: Single-ended Bi-directional Buffer with Digital Controlled Impedance (DCI)
--               and Input path enable/disable

IOBUF_INTERMDISABLE

Primitive: Bi-Directional Single-ended Buffer with Input Termination Disable and Input Path Disable

Introduction

The design element is a bidirectional single-ended I/O Buffer used to connect internal logic to an external bidirectional pin. This element include uncalibrated input termination (INTERM) disable as well as input path disable as additional power saving features when the I/O is either is an unused state or being used as an output for several clock cycles. This element may only be placed in High Range (HR) banks in the 7 series devices.

Port Descriptions

| Port | Direction | Width | Function |
|---------------|-----------|-------|--|
| O | Output | 1 | Buffer output representing the input path to the device. |
| IO | In/out | 1 | Bi-directional port connection. Connect directly to top-level port in the design. |
| I | Input | 1 | Buffer input representing the output path to the device. |
| IBUFDISABLE | Input | 1 | Disables input path through the buffer and forces to a logic high when USE_IBUFDISABLE is set to "TRUE". If USE_IBUFDISABLE is set to "FALSE" this input is ignored and should be tied to ground. This feature is generally used to reduce power at times when the I/O is either idle or during sustained write (output) conditions. |
| INTERMDISABLE | Input | 1 | Disables input termination. This feature is generally used to reduce power at times when the I/O is either idle or during sustained write (output) conditions. |
| T | Input | 1 | Sets the I/O in a high impedance 3-state mode when the I/O is being used for a read (input) operation. The T pin also affects the IBUFDISABLE function when USE_IBUFDISABLE = "TRUE". The T pin also disables INTERM when in a write (output) mode. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------------|-----------|------------------------|-----------|--|
| DRIVE | Integer | 2, 4, 6, 8, 12, 16, 24 | 12 | Selects output drive strength (mA) for the SelectIO™ buffers. |
| IBUF_LOW_PWR | String | "TRUE", "FALSE" | "TRUE" | Allows a trade off of lower power consumption vs. highest performance. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| SLEW | String | "SLOW", "FAST" | "SLOW" | Sets the output rise and fall time. See the Data Sheet for recommendations of the best setting for this attribute. |
| USE_IBUFDISABLE | String | "TRUE", "FALSE" | "TRUE" | Enables or disables the feature of IBUFDISABLE. Generally used when it is not desirable to have the T pin disable input path to allow a read during write operation. |

VHDL Instantiation Template

IOBUFDS

Primitive: 3-State Differential Signaling I/O Buffer with Active Low Output Enable

Introduction

The design element is a bidirectional buffer that supports low-voltage, differential signaling. For the IOBUFDS, a design level interface signal is represented as two distinct ports (IO and IOB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET_P and MYNET_N). Optionally, a programmable differential termination feature is available to help improve signal integrity and reduce external components. Also available is a programmable delay to assist in the capturing of incoming data to the device.

Logic Table

| Inputs | | Bidirectional | | Outputs |
|--------|---|---------------|-----|-----------|
| I | T | IO | IOB | O |
| X | 1 | Z | Z | No Change |
| 0 | 0 | 0 | 1 | 0 |
| 1 | 0 | 1 | 0 | 1 |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|----------------------|
| O | Output | 1 | Buffer output |
| IO | In/out | 1 | Diff_p In/out |
| IOB | In/out | 1 | Diff_n In/out |
| I | Input | 1 | Buffer input |
| T | Input | 1 | 3-state enable input |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|--------------|-----------|------------------|-----------|--|
| DIFF_TERM | Boolean | TRUE, FALSE | FALSE | The differential termination attribute is designed for the 7 Series FPGA supported differential input I/O standards. It is used to turn the built-in differential termination on (TRUE) or off (FALSE). |
| IBUF_LOW_PWR | Boolean | TRUE, FALSE | TRUE | When set to TRUE, allows for reduced power when using differential or referenced (requiring V_{REF}) input standards like LVDS or HSTL. A setting of FALSE demands more power but delivers higher performance characteristics. Consult the 7 Series FPGA SelectIO Resources User Guide for details. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| SLEW | String | "SLOW" or "FAST" | "SLOW" | Specifies the slew rate of the output driver. Consult the product Data Sheet for recommendations of the best setting for this attribute. |

IOBUFDS_DCIEN

Primitive: Bi-Directional Differential Buffer with DCI Enable/Disable and Input Disable

Introduction

This design element is a bidirectional differential I/O buffer used to connect internal logic to an external bidirectional pin. This element includes Digitally Controlled Impedance (DCI) termination enable/disable as well as input path disable as additional power saving features when the I/O is either in an unused state or being used as an output for a sustained amount of time. This element may only be placed in High Performance (HP) banks in the 7 series devices.

Port Descriptions

| Port | Direction | Width | Function |
|----------------|-----------|-------|---|
| IO | In/out | 1 | Bi-directional p-side port connection. Connect directly to top-level port in the design. |
| IOB | In/out | 1 | Bi-directional p-side port connection. Connect directly to top-level port in the design. |
| I | Input | 1 | Buffer input representing the output path to the device. |
| IBUFDSISABLE | Input | 1 | Disables input path. When this signal is asserted HIGH and the attribute USE_IBUFDSISABLE is set to "TRUE", the input path through the input buffer is disabled and forced to a logic HIGH.. If USE_IBUFDSISABLE is set to "FALSE" this input is ignored and should be tied to ground. This feature is generally used to reduce power at times when the I/O is either idle or during sustained write (output) conditions. |
| DCITERMDISABLE | Input | 1 | Disables DCI termination. When this signal is asserted HIGH, DCI termination is disabled. This feature is generally used to reduce power at times when the I/O is either idle or during sustained write (output) conditions. |
| T | Input | 1 | Sets the I/O in a high impedance 3-state mode when the I/O is being used for a read (input) operation. The T pin also affects the IBUFDSISABLE function when USE_IBUFDSISABLE = "TRUE". |
| O | Output | 1 | Buffer output representing the input path to the device. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------------|-----------|-----------------|-----------|---|
| DIFF_TERM | String | "TRUE", "FALSE" | "FALSE" | Enable the built-in differential termination. |
| IBUF_LOW_PWR | String | "TRUE", "FALSE" | "TRUE" | Allows a trade off of lower power consumption vs. highest performance. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| SLEW | String | "SLOW", "FAST", | "SLOW" | Sets the output rise and fall time. See the Data Sheet for recommendations of the best setting for this attribute. |
| USE_IBUFDISABLE | String | "TRUE", "FALSE" | "TRUE" | Enables or disables the feature of IBUFDISABLE. Set to FALSE when it is not desirable to have the T pin disable input path to allow a read during write operation. When set to TRUE deasserting T (IO used as output) or asserting IBUFDISABLE will disable the input path through the buffer and forces to a logic high. |

IOBUFDS_DIFF_OUT

Primitive: Differential Bi-directional Buffer with Differential Output

Introduction

This design element is a bidirectional buffer that supports low-voltage, differential signaling. For the IOBUFDS_DIFF_OUT, a design level interface signal is represented as two distinct ports (IO and IOB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET_P and MYNET_N). The IOBUFDS_DIFF_OUT differs from the IOBUFDS in that it allows internal access to both phases of the differential signal. Optionally, a programmable differential termination feature is available to help improve signal integrity and reduce external components.

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|---|
| O | Output | 1 | Buffer p-side output |
| OB | Output | 1 | Buffer n-side output |
| IO | In/out | 1 | Diff_p In/out (connect directly to top-level port) |
| IOB | In/out | 1 | Diff_n In/out (connect directly to top-level port) |
| I | Input | 1 | Buffer input |
| TM | Input | 1 | 3-state enable input from master OLOGIC, high=input, low=output |
| TS | Input | 1 | 3-state enable input from slave OLOGIC, high=input, low=output |

IOBUFDS_DIFF_OUT_INTERMDISABLE

Primitive: Bi-Directional Differential Buffer with Input Termination Disable, Input Disable, and Differential Output

Introduction

This design element is a bidirectional differential I/O Buffer used to connect internal logic to an external bidirectional pin. This element includes an uncalibrated input termination (INTERM) disable as well as input path disable as additional power saving features when the I/O is either is an unused state or being used as an output for several clock cycles. The IOBUFDS_DIFF_OUT_INTERMDISABLE differs from the IOBUFDS_INTERMDISABLE in that it allows internal access to both phases of the differential signal. This element may only be placed in High Range (HR) banks in the 7 series devices.

Port Descriptions

| Port | Direction | Width | Function |
|---------------|-----------|-------|--|
| IO | In/out | 1 | Bi-directional p-side port connection. Connect directly to top-level port in the design. |
| IOB | In/out | 1 | Bi-directional n-side port connection. Connect directly to top-level port in the design. |
| I | Input | 1 | Buffer input representing the output path to the device. |
| IBUFDISABLE | Input | 1 | Disables input path through the buffer and forces to a logic high when USE_IBUFDISABLE is set to "TRUE". If USE_IBUFDISABLE is set to "FALSE" this input is ignored and should be tied to ground. This feature is generally used to reduce power at times when the I/O is either idle or during sustained write (output) conditions. |
| INTERMDISABLE | Input | 1 | Disables input termination. This feature is generally used to reduce power at times when the I/O is either idle or during sustained write (output) conditions. |
| TM | Input | 1 | P-side or master side of the high impedance 3-state mode when the I/O is being used for a read (input) operation. The TM pin also affects the IBUFDISABLE function when USE_IBUFDISABLE = "TRUE", and disables INTERM when in a write (output) mode. |
| TS | Input | 1 | N-side or slave side of the high impedance 3-state mode when the I/O is being used for a read (input) operation. The TS pin also affects the IBUFDISABLE function when |

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| | | | USE_IBUFDISABLE = "TRUE", and disables INTERM when in a write (output) mode. |
| O | Output | 1 | Buffer p-side output representing the input path to the device. |
| OB | Output | 1 | Buffer n-side output representing the input path to the device. |

Design Entry Method

| | |

IOBUFDS_INTERMDISABLE

Primitive: Bi-Directional Differential Buffer with Input Termination Disable and Input Disable

Introduction

This design element is a bidirectional differential I/O buffer used to connect internal logic to an external bidirectional pin. This element includes an uncalibrated input termination (INTERM) disable as well as an input path disable as additional power saving features when the I/O is either is an unused state or being used as an output for a sustained amount of time. This element may only be placed in High Range (HR) banks in 7 series devices.

Port Descriptions

| Port | Direction | Width | Function |
|---------------|-----------|-------|--|
| IO | In/out | 1 | Bi-directional p-side port connection. Connect directly to top-level port in the design. |
| IOB | In/out | 1 | Bi-directional n-side port connection. Connect directly to top-level port in the design. |
| I | Input | 1 | Buffer input representing the output path to the device. |
| IBUFDISABLE | Input | 1 | Disables input path through the buffer and forces to a logic high when USE_IBUFDISABLE is set to "TRUE". If USE_IBUFDISABLE is set to "FALSE" this input is ignored and should be tied to ground. This feature is generally used to reduce power at times when the I/O is either idle or during sustained write (output) conditions. |
| INTERMDISABLE | Input | 1 | Disables input termination. This feature is generally used to reduce power at times when the I/O is either idle or during sustained write (output) conditions. |
| T | Input | 1 | Sets the I/O in a high impedance 3-state mode when the I/O is being used for a read (input) operation. The T pin also affects the IBUFDISABLE function when USE_IBUFDISABLE = "TRUE". The T pin also disables INTERM when in a write (output) mode. |
| O | Output | 1 | Buffer output representing the input path to the device. |

Design Entry Method

| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------------|-----------|------------------|-----------|--|
| DIFF_TERM | String | "TRUE", "FALSE" | "FALSE" | Enable the built-in differential termination. |
| IBUF_LOW_PWR | String | "TRUE", "FALSE" | "TRUE" | Allows a trade off of lower power consumption vs. highest performance when referenced I/O standards are used. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| SLEW | String | "SLOW" or "FAST" | "SLOW" | Sets the output rise and fall time. See the Data Sheet for recommendations of the best setting for this attribute. |
| USE_IBUFDISABLE | String | "TRUE", "FALSE" | "TRUE" | Enables or disables the feature of IBUFDISABLE. Generally used when it is not desirable to have the T pin disable input path to allow a read during write operation. |

ISERDESE2

Primitive: Input SERIAL/DESerializer with Bitslip

Introduction

The ISERDESE2 in 7 series FPGAs is a dedicated serial-to-parallel converter with specific clocking and logic features designed to facilitate the implementation of high-speed source-synchronous applications. The ISERDESE2 avoids the additional timing complexities encountered when designing deserializers in the FPGA fabric. ISERDESE2 features include:

- Dedicated Deserializer/Serial-to-Parallel Converter, which enables high-speed data transfer without requiring the FPGA fabric to match the input data frequency. This converter supports both single data rate (SDR) and double data rate (DDR) modes. In SDR mode, the serial-to-parallel converter creates a 2-, 3-, 4-, 5-, 6-, 7-, or 8-bit wide parallel word. In DDR mode, the serial-to-parallel converter creates a 4-, 6-, 8-, 10-, or 14-bit-wide parallel word.
- Bitslip Submodule, which lets designers reorder the sequence of the parallel data stream going into the FPGA fabric. This can be used for training source-synchronous interfaces that include a training pattern.
- Dedicated Support for Strobe-based Memory Interfaces, including the OCLK input pin, to handle the strobe-to-FPGA clock domain crossover entirely within the ISERDESE2 block. This allows for higher performance and a simplified implementation.
- Dedicated Support for Networking Interfaces
- Dedicated Support for Memory Interfaces

Port Descriptions

| Port | Type | Width | Function |
|--------------|--------|-------|---|
| BITSLIP | Input | 1 | The BITSLIP pin performs a Bitslip operation synchronous to CLKDIV when asserted (active High). Subsequently, the data seen on the Q1 to Q8 output ports will shift, as in a barrel-shifter operation, one position every time Bitslip is invoked (DDR operation is different from SDR). |
| CE1, CE2 | Input | 1 | Each ISERDESE2 block contains an input clock enable module. When NUM_CE = 1, the CE2 input is not used, and the CE1 input is an active high clock enable connected directly to the input registers in the ISERDESE2. When NUM_CE = 2, the CE1 and CE2 inputs are both used, with CE1 enabling the ISERDESE2 for half of a CLKDIV cycle, and CE2 enabling the ISERDESE2 for the other half. The clock enable module functions as a 2:1 serial-to-parallel converter, clocked by CLKDIV. The clock enable module is needed specifically for bidirectional memory interfaces when ISERDESE2 is configured for 1:4 deserialization in DDR mode. When the attribute NUM_CE = 2, the clock enable module is enabled and both CE1 and CE2 ports are available. When NUM_CE = 1, only CE1 is available and functions as a regular clock enable. |
| CLK | Input | 1 | The high-speed clock input (CLK) is used to clock in the input serial data stream. |
| CLKB | Input | 1 | The high-speed secondary clock input (CLKB) is used to clock in the input serial data stream. In any mode other than "MEMORY_QDR", connect CLKB to an inverted version of CLK. In "MEMORY_QDR" mode CLKB should be connected to a unique, phase shifted clock. |
| CLKDIV | Input | 1 | The divided clock input (CLKDIV) is typically a divided version of CLK (depending on the width of the implemented deserialization). It drives the output of the serial-to-parallel converter, the Bitslip submodule, and the CE module. |
| CLKDIVP | Input | 1 | Only supported in MIG. Sourced by PHASER_IN divided CLK in MEMORY_DDR3 mode. All other modes connect to ground. |
| D | Input | 1 | The serial input data port (D) is the serial (high-speed) data input port of the ISERDESE2. This port works in conjunction only with the 7 series FPGA I/O resource. |
| DDLY | Input | 1 | The serial input data port (DDLY) is the serial (high-speed) data input port of the ISERDESE2. This port works in conjunction only with the 7 series FPGA IDELAYE2 resource. |
| DYNCLKDIVSEL | Input | 1 | Dynamically select CLKDIV inversion. |
| DYNCLKSEL | Input | 1 | Dynamically select CLK and CLKB inversion. |
| O | Output | 1 | The combinatorial output port (O) is an unregistered output of the ISERDESE2 module. This output can come directly from the data input (D), or from the data input (DDLY) via the IDELAYE2. |
| OCLK | Input | 1 | The OCLK clock input synchronizes data transfer in strobe-based memory interfaces. The OCLK clock is only used when INTERFACE_TYPE is set to "MEMORY". The OCLK clock input is used to transfer strobe-based memory data onto a free-running clock domain. OCLK is a free-running FPGA clock at the same frequency as the strobe on the CLK input. The timing of the domain transfer is set by the user by adjusting the delay of the strobe signal to the CLK input (e.g., using IDELAY). Examples of setting the timing of this domain transfer are given in the Memory Interface Generator (MIG). When INTERFACE_TYPE is "NETWORKING", this port is unused and should be connected to GND. |
| OCLKB | Input | 1 | The OCLKB clock input synchronizes data transfer in strobe-based memory interfaces. The OCLKB clock is only used when INTERFACE_TYPE is set to "MEMORY". |

| Port | Type | Width | Function |
|-------------------------|--------|-------|--|
| OFB | Input | 1 | The serial input data port (OFB) is the serial (high-speed) data input port of the ISERDESE2. This port works in conjunction only with the 7 series FPGA OSERDESE2 port OFB. |
| Q1 - Q8 | Output | 1 | The output ports Q1 to Q8 are the registered outputs of the ISERDESE2 module. One ISERDESE2 block can support up to eight bits (i.e., a 1:8 deserialization). Bit widths greater than eight (up to 14) can be supported using Width Expansion. The first data bit received appears on the highest order Q output. The bit ordering at the input of an OSERDESE2 is the opposite of the bit ordering at the output of an ISERDESE2 block. For example, the least significant bit A of the word FEDCBA is placed at the D1 input of an OSERDESE2, but the same bit A emerges from the ISERDESE2 block at the Q8 output. In other words, D1 is the least significant input to the OSERDESE2, while Q8 is the least significant output of the ISERDESE2 block. When width expansion is used, D1 of the master OSERDESE1 is the least significant input, while Q7 of the slave ISERDESE2 block is the least significant output. |
| RST | Input | 1 | The reset input causes the outputs of all data flip-flops in the CLK and CLKDIV domains to be driven low asynchronously. ISERDESE2 circuits running in the CLK domain where timing is critical use an internal, dedicated circuit to retime the RST input to produce a reset signal synchronous to the CLK domain. Similarly, there is a dedicated circuit to retime the RST input to produce a reset signal synchronous to the CLKDIV domain. Because the ISERDESE2 is driven into reset asynchronously but comes out of reset synchronously it must be treated as a synchronous reset to the CLKDIV time domain and have a minimum pulse of one CLKDIV cycle. When building an interface consisting of multiple ISERDESE2 ports, all ISERDESE2 ports in the interface must be synchronized. The internal retiming of the RST input is designed so that all ISERDESE2 blocks that receive the same reset pulse come out of reset synchronized with one another. |
| SHIFTIN1, SHIFTIN2 | Input | 1 | If SERDES_MODE="SLAVE", connect SHIFTIN1/2 to the master ISERDESE2 SHIFTOUT1/2 outputs. Otherwise, leave SHIFTOUT1/2 unconnected and/or SHIFTIN1/2 grounded. |
| SHIFTOUT1, SHIFTOUT2 | Output | 1 | If SERDES_MODE="MASTER" and two ISERDESE2s are to be cascaded, connect SHIFTOUT1/2 to the slave ISERDESE2 SHIFTIN1/2 inputs. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|---|---------|---|----------|--|
| DATA_RATE | STRING | "DDR", "SDR" | "DDR" | The DATA_RATE attribute defines whether the incoming data stream is processed as single data rate (SDR) or double data rate (DDR). |
| DATA_WIDTH | DECIMAL | 4, 2, 3, 5, 6, 7, 8, 10, 14 | 4 | Defines the width of the serial-to-parallel converter. The legal value depends on the DATA_RATE attribute (SDR or DDR). <ul style="list-style-type: none"> If DATA_RATE = DDR, value is limited to 4, 6, 8, 10 or 14. If DATA_RATE = SDR, value is limited to 2, 3, 4, 5, 6, 7, or 8. |
| DYN_CLKDIV_INV_EN | STRING | "FALSE", "TRUE" | "FALSE" | Enables DYNCLKDIVINVSEL inversion when TRUE and disables HDL inversions on CLKDIV pin. |
| DYN_CLK_INV_EN | STRING | "FALSE", "TRUE" | "FALSE" | Enables DYNCLKINVSEL inversion when TRUE and disables HDL inversions on CLK and CLKB pins. |
| INIT_Q1, INIT_Q2, INIT_Q3, INIT_Q4 | BINARY | 1'b0 to 1'b1 | 1'b0 | Defines the initial value on the Q1 through Q4 outputs after configuration. |
| INTERFACE_TYPE | STRING | "MEMORY", "MEMORY_DDR3", "MEMORY_QDR", "NETWORKING", "OVERSAMPLE" | "MEMORY" | Specifies mode of operation for the ISERDESE2. For details on each mode, please refer to the 7 series FPGA SelectIO Resources User Guide. |
| IOBDELAY | STRING | "NONE", "BOTH", "IBUF", "IFD" | "NONE" | Defines input sources for ISERDESE2 module. The D and DDLY pins are dedicated inputs to the ISERDESE2. The D input is a direct connection to the I/O. The DDLY pin is a direct connection to the IODELAYE2. This allows the user to either have a delayed or non-delayed version of the input to the registered (Q1- Q6) or combinatorial path (O) output. The attribute IOBDELAY determines the input applied the output. <ul style="list-style-type: none"> "NONE" - O => D Q1-Q6 => D "IBUF" - O => DDLY Q1-Q6 => D "IFD" - O => D Q1-Q6 => DDLY "BOTH" - O => DDLY Q1-Q6 => DDLY |
| NUM_CE | DECIMAL | 2, 1 | 2 | The NUM_CE attribute defines the number of clock enables (CE1 and CE2) used. |
| OFB_USED | STRING | "FALSE", "TRUE" | "FALSE" | Enables the path from the OLOGIC, OSERDES OFB pin to the ISERDES OFB pin. Disables the use of the D input pin. |

| Attribute | Type | Allowed Values | Default | Description |
|---|--------|-------------------|----------|---|
| SERDES_MODE | STRING | "MASTER", "SLAVE" | "MASTER" | The SERDES_MODE attribute defines whether the ISERDESE2 module is a master or slave when using width expansion. Set to "MASTER" when not using width expansion. |
| SRVAL_Q1, SRVAL_Q2, SRVAL_Q3, SRVAL_Q4 | BINARY | 1'b0 to 1'b1 | 1'b0 | Defines the value (set or reset) of Q1 through Q4 outputs when the SR pin is invoked. |

KEEPER

Primitive: KEEPER Symbol

Introduction

The design element is a weak keeper element that retains the value of the net connected to its bidirectional O pin. For example, if a logic 1 is being driven onto the net, KEEPER drives a weak/resistive 1 onto the net. If the net driver is then 3-stated, KEEPER continues to drive a weak/resistive 1 onto the net.

Port Descriptions

| Name | Direction | Width | Function |
|------|-----------|-------|---------------|
| O | Output | 1-Bit | Keeper output |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- KEEPER: I/O Buffer Weak Keeper
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

KEEPER_inst : KEEPER
port map (
  O => O      -- Keeper output (connect directly to top-level port)
);

-- End of KEEPER_inst instantiation
```

Verilog Instantiation Template

```
// KEEPER: I/O Buffer Weak Keeper
//      7 Series
// Xilinx HDL Libraries Guide, version 14.7

KEEPER KEEPER_inst (
    .O(0)      // Keeper output (connect directly to top-level port)
);

// End of KEEPER_inst instantiation
```

For More Information

See the [7 Series FPGA User Documentation \(User Guides and Data Sheets\)](#).

LDCE

Primitive: Transparent Data Latch with Asynchronous Clear and Gate Enable

Introduction

This design element is a transparent data latch with asynchronous clear and gate enable. When the asynchronous clear input (CLR) is High, it overrides the other inputs and resets the data (Q) output Low. Q reflects the data (D) input while the gate (G) input and gate enable (GE) are High and CLR is Low. If (GE) is Low, data on (D) cannot be latched. The data on the (D) input during the High-to-Low gate transition is stored in the latch. The data on the (Q) output remains unchanged as long as (G) or (GE) remains low.

This latch is asynchronously cleared, outputs Low, when power is applied. Power-on conditions are simulated when global set/reset (GSR) is active.

Logic Table

| Inputs | | | | Outputs |
|--------|----|---|---|-----------|
| CLR | GE | G | D | Q |
| 1 | X | X | X | 0 |
| 0 | 0 | X | X | No Change |
| 0 | 1 | 1 | D | D |
| 0 | 1 | 0 | X | No Change |
| 0 | 1 | ↓ | D | D |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-----------|----------------|---------|---|
| INIT | Binary | 0, 1 | 0 | Sets the initial value of Q output after configuration. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- LDCE: Transparent latch with Asynchronous Reset and
--       Gate Enable.
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

LDCE_inst : LDCE
generic map (
  INIT => '0') -- Initial value of latch ('0' or '1')
port map (
  Q => Q,      -- Data output
  CLR => CLR,  -- Asynchronous clear/reset input
  D => D,      -- Data input
  G => G,      -- Gate input
  GE => GE    -- Gate enable input
);

-- End of LDCE_inst instantiation
```

Verilog Instantiation Template

```
// LDCE: Transparent latch with Asynchronous Reset and Gate Enable.
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

LDCE #(
  .INIT(1'b0) // Initial value of latch (1'b0 or 1'b1)
) LDCE_inst (
  .Q(Q),      // Data output
  .CLR(CLR),  // Asynchronous clear/reset input
  .D(D),      // Data input
  .G(G),      // Gate input
  .GE(GE)    // Gate enable input
);

// End of LDCE_inst instantiation
```

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

LDPE

Primitive: Transparent Data Latch with Asynchronous Preset and Gate Enable

Introduction

This design element is a transparent data latch with asynchronous preset and gate enable. When the asynchronous preset (PRE) is High, it overrides the other input and presets the data (Q) output High. Q reflects the data (D) input while the gate (G) input and gate enable (GE) are High. The data on the (D) input during the High-to-Low gate transition is stored in the latch. The data on the (Q) output remains unchanged as long as (G) or (GE) remains Low.

This latch is asynchronously preset, output High, when power is applied. Power-on conditions are simulated when global set/reset (GSR) is active.

Logic Table

| Inputs | | | | Outputs |
|--------|----|---|---|-----------|
| PRE | GE | G | D | Q |
| 1 | X | X | X | 1 |
| 0 | 0 | X | X | No Change |
| 0 | 1 | 1 | D | D |
| 0 | 1 | 0 | X | No Change |
| 0 | 1 | ↓ | D | D |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-----------|----------------|---------|---|
| INIT | Binary | 0, 1 | 1 | Specifies the initial value upon power-up or the assertion of GSR for the (Q) port. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- LDPE: Transparent latch with Asynchronous Set and
--       Gate Enable.
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

LDPE_inst : LDPE
generic map (
  INIT => '0') -- Initial value of latch ('0' or '1')
port map (
  Q => Q,      -- Data output
  CLR => CLR,  -- Asynchronous preset/set input
  D => D,      -- Data input
  G => G,      -- Gate input
  GE => GE    -- Gate enable input
);

-- End of LDPE_inst instantiation
```

Verilog Instantiation Template

```
// LDPE: Transparent latch with Asynchronous Preset and Gate Enable.
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

LDPE #(
  .INIT(1'b1) // Initial value of latch (1'b0 or 1'b1)
) LDPE_inst (
  .Q(Q),      // Data output
  .PRE(PRE),  // Asynchronous preset/set input
  .D(D),      // Data input
  .G(G),      // Gate input
  .GE(GE)    // Gate enable input
);

// End of LDPE_inst instantiation
```

LUT1

Primitive: 1-Bit Look-Up Table with General Output

Introduction

This design element is a 1-bit look-up table (LUT) with general output (O).

An INIT attribute with an appropriate number of hexadecimal digits for the number of inputs must be attached to the LUT to specify its function. This element provides a look-up table version of a buffer or inverter. These elements are the basic building blocks. Multiple variants of LUTs accommodate additional types of outputs that can be used by different timing models for more accurate pre-layout timing estimation.

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

The Logic Table Method -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.

The Equation Method -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation you are after. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

| Inputs | Outputs |
|---|----------|
| I0 | O |
| 0 | INIT[0] |
| 1 | INIT[1] |
| INIT = Binary number assigned to the INIT attribute | |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|-----------------|-----------|-----------------------------|
| INIT | Hexadecimal | Any 2-Bit Value | All zeros | Initializes look-up tables. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- LUT1: 1-input Look-Up Table with general output
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

LUT1_inst : LUT1
generic map (
  INIT => "00")
port map (
  O => O,    -- LUT general output
  I0 => I0   -- LUT input
);

-- End of LUT1_inst instantiation
```

Verilog Instantiation Template

```
// LUT1: 1-input Look-Up Table with general output (Mapped to a LUT6)
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

LUT1 #(
  .INIT(2'b00) // Specify LUT Contents
) LUT1_inst (
  .O(O),      // LUT general output
  .I0(I0)    // LUT input
);

// End of LUT1_inst instantiation
```

LUT1_D

Primitive: 1-Bit Look-Up Table with Dual Output

Introduction

This design element is a 1-bit look-up table (LUT) with two functionally identical outputs, O and LO. It provides a look-up table version of a buffer or inverter.

The O output is a general interconnect. The LO output is used to connect to another input within the same CLB slice. A mandatory INIT attribute, with an appropriate number of hexadecimal digits for the number of inputs, must be attached to the LUT to specify its function.

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

- **The Logic Table Method** -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.
- **The Equation Method** -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

| Inputs | Outputs | |
|--------|---------|---------|
| I0 | O | LO |
| 0 | INIT[0] | INIT[0] |
| 1 | INIT[1] | INIT[1] |

INIT = Binary number assigned to the INIT attribute

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|-----------------|-----------|-----------------------------|
| INIT | Hexadecimal | Any 2-Bit Value | All zeros | Initializes look-up tables. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

LUT3

Primitive: 3-Bit Look-Up Table with General Output

Introduction

This design element is a 3-bit look-up table (LUT) with general output (O). A mandatory INIT attribute, with an appropriate number of hexadecimal digits for the number of inputs, must be attached to the LUT to specify its function.

An INIT attribute with an appropriate number of hexadecimal digits for the number of inputs must be attached to the LUT to specify its function. This element provides a look-up table version of a buffer or inverter. These elements are the basic building blocks. Multiple variants of LUTs accommodate additional types of outputs that can be used by different timing models for more accurate pre-layout timing estimation.

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

The Logic Table Method -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.

The Equation Method -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation you are after. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

| Inputs | | | Outputs |
|--------|----|----|---------|
| I2 | I1 | I0 | O |
| 0 | 0 | 0 | INIT[0] |
| 0 | 0 | 1 | INIT[1] |
| 0 | 1 | 0 | INIT[2] |
| 0 | 1 | 1 | INIT[3] |
| 1 | 0 | 0 | INIT[4] |
| 1 | 0 | 1 | INIT[5] |
| 1 | 1 | 0 | INIT[6] |
| 1 | 1 | 1 | INIT[7] |

INIT = Binary equivalent of the hexadecimal number assigned to the INIT attribute

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|-----------------|-----------|-----------------------------|
| INIT | Hexadecimal | Any 8-Bit Value | All zeros | Initializes look-up tables. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- LUT3: 3-input Look-Up Table with general output (Mapped to a LUT6)
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

LUT3_inst : LUT3
generic map (
  INIT => X"00")
port map (
  O => O,  -- LUT general output
  I0 => I0, -- LUT input
  I1 => I1, -- LUT input
  I2 => I2 -- LUT input
);

-- End of LUT3_inst instantiation
```

Verilog Instantiation Template

```
// LUT3: 3-input Look-Up Table with general output (Mapped to a LUT6)
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

LUT3 #(
  .INIT(8'h00) // Specify LUT Contents
) LUT3_inst (
  .O(O), // LUT general output
  .I0(I0), // LUT input
  .I1(I1), // LUT input
  .I2(I2) // LUT input
);

// End of LUT3_inst instantiation
```

LUT3_D

Primitive: 3-Bit Look-Up Table with Dual Output

Introduction

This design element is a 3-bit look-up table (LUT) with two functionally identical outputs, O and LO.

The O output is a general interconnect. The LO output is used to connect to another input within the same CLB slice. A mandatory INIT attribute, with an appropriate number of hexadecimal digits for the number of inputs, must be attached to the LUT to specify its function.

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

- **The Logic Table Method** -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.
- **The Equation Method** -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

| Inputs | | | Outputs | |
|--------|----|----|---------|---------|
| I2 | I1 | I0 | O | LO |
| 0 | 0 | 0 | INIT[0] | INIT[0] |
| 0 | 0 | 1 | INIT[1] | INIT[1] |
| 0 | 1 | 0 | INIT[2] | INIT[2] |
| 0 | 1 | 1 | INIT[3] | INIT[3] |
| 1 | 0 | 0 | INIT[4] | INIT[4] |
| 1 | 0 | 1 | INIT[5] | INIT[5] |
| 1 | 1 | 0 | INIT[6] | INIT[6] |
| 1 | 1 | 1 | INIT[7] | INIT[7] |

INIT = Binary equivalent of the hexadecimal number assigned to the INIT attribute

Design Entry Method

LUT5

Primitive: 5-Input Lookup Table with General Output

Introduction

This design element is a 5-input, 1-output look-up table (LUT) that can either act as an asynchronous 32-bit ROM (with 5-bit addressing) or implement any 5-input logic function. LUTs are the basic logic building blocks and are used to implement most logic functions of the design. One LUT5 is packed into a LUT6 within a slice, or two LUT5s can be packed into a single LUT6 with some restrictions. The functionality of the LUT5, LUT5_L and LUT5_D is the same. However, the LUT5_L and LUT5_D allow the additional specification to connect the LUT5 output signal to an internal slice or CLB connection using the LO output. The LUT5_L specifies that the only connections from the LUT5 will be within a slice or CLB, while the LUT5_D allows the specification to connect the output of the LUT to both inter-slice/CLB logic and external logic as well. The LUT5 does not state any specific output connections and should be used in all cases except where internal slice or CLB signal connections must be implicitly specified.

An INIT attribute consisting of a 32-bit hexadecimal value must be specified to indicate the LUTs logical function. The INIT value is calculated by assigning a 1 to the corresponding INIT bit value when the associated inputs are applied. For instance, a Verilog INIT value of 32'h80000000 (X"80000000" for VHDL) makes the output zero unless all of the inputs are one (a 5-input AND gate). A Verilog INIT value of 32'hffffffe (X"FFFFFFFE" for VHDL) makes the output one unless all zeros are on the inputs (a 5-input OR gate).

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

The Logic Table Method -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.

The Equation Method -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation you are after. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

| Inputs | | | | | Outputs |
|--------|----|----|----|----|---------|
| I4 | I3 | I2 | I1 | I0 | LO |
| 0 | 0 | 0 | 0 | 0 | INIT[0] |
| 0 | 0 | 0 | 0 | 1 | INIT[1] |
| 0 | 0 | 0 | 1 | 0 | INIT[2] |

INIT = Binary equivalent of the hexadecimal number assigned to the INIT attribute

Port Description

| Name | Direction | Width | Function |
|--------------------|-----------|-------|--------------|
| O | Output | 1 | 5-LUT output |
| I0, I1, I2, I3, I4 | Input | 1 | LUT inputs |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|------------------|-----------|---|
| INIT | Hexadecimal | Any 32-Bit Value | All zeros | Specifies the logic value for the look-up tables. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- LUT5: 5-input Look-Up Table with general output (Mapped to SliceM LUT6)
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

LUT5_inst : LUT5
generic map (
  INIT => X"00000000") -- Specify LUT Contents
port map (
  O => O, -- LUT general output
  I0 => I0, -- LUT input
  I1 => I1, -- LUT input
  I2 => I2, -- LUT input
  I3 => I3, -- LUT input
  I4 => I4 -- LUT input
);

-- End of LUT5_inst instantiation
```

Verilog Instantiation Template

```
// LUT5: 5-input Look-Up Table with general output (Mapped to a LUT6)
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

LUT5 #(
  .INIT(32'h00000000) // Specify LUT Contents
) LUT5_inst (
  .O(O), // LUT general output
  .I0(I0), // LUT input
  .I1(I1), // LUT input
  .I2(I2), // LUT input
  .I3(I3), // LUT input
  .I4(I4) // LUT input
);

// End of LUT5_inst instantiation
```

LUT5_D

Primitive: 5-Input Lookup Table with General and Local Outputs

Introduction

This design element is a 5-input, 1-output look-up table (LUT) that can either act as an asynchronous 32-bit ROM (with 5-bit addressing) or implement any 5-input logic function. LUTs are the basic logic building blocks and are used to implement most logic functions of the design. One LUT5 will be packed into a LUT6 within a slice, or two LUT5s can be packed into a single LUT6 with some restrictions. The functionality of the LUT5, LUT5_L and LUT5_D is the same. However, the LUT5_L and LUT5_D allow the additional specification to connect the LUT5 output signal to an internal slice or CLB connection using the LO output. The LUT5_L specifies that the only connections from the LUT5 will be within a slice or CLB, while the LUT5_D allows the specification to connect the output of the LUT to both inter-slice/CLB logic and external logic. The LUT5 does not state any specific output connections and should be used in all cases except where internal slice or CLB signal connections must be implicitly specified.

An INIT attribute consisting of a 32-bit hexadecimal value must be specified to indicate the LUTs logical function. The INIT value is calculated by assigning a 1 to the corresponding INIT bit value when the associated inputs are applied. For instance, a Verilog INIT value of 32'h80000000 (X"80000000" for VHDL) will make the output zero unless all of the inputs are one (a 5-input AND gate). A Verilog INIT value of 32'hffffffe (X"FFFFFFFE" for VHDL) will make the output one unless all zeros are on the inputs (a 5-input OR gate).

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

- **The Logic Table Method** -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.
- **The Equation Method** -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

| Inputs | | | | | Outputs | |
|--------|----|----|----|----|---------|---------|
| I4 | I3 | I2 | I1 | I0 | O | LO |
| 0 | 0 | 0 | 0 | 0 | INIT[0] | INIT[0] |
| 0 | 0 | 0 | 0 | 1 | INIT[1] | INIT[1] |
| 0 | 0 | 0 | 1 | 0 | INIT[2] | INIT[2] |
| 0 | 0 | 0 | 1 | 1 | INIT[3] | INIT[3] |
| 0 | 0 | 1 | 0 | 0 | INIT[4] | INIT[4] |

LUT5_L

Primitive: 5-Input Lookup Table with Local Output

Introduction

This design element is a 5-input, 1-output look-up table (LUT) that can either act as an asynchronous 32-bit ROM (with 5-bit addressing) or implement any 5-input logic function. LUTs are the basic logic building blocks and are used to implement most logic functions of the design. One LUT5 will be packed into a LUT6 within a slice, or two LUT5s can be packed into a single LUT6 with some restrictions. The functionality of the LUT5, LUT5_L and LUT5_D is the same. However, the LUT5_L and LUT5_D allow the additional specification to connect the LUT5 output signal to an internal slice or CLB connection using the LO output. The LUT5_L specifies that the only connections from the LUT5 is within a slice or CLB, while the LUT5_D allows the specification to connect the output of the LUT to both inter-slice/CLB logic and external logic as well. The LUT5 does not state any specific output connections and should be used in all cases except where internal slice or CLB signal connections must be implicitly specified.

An INIT attribute consisting of a 32-bit hexadecimal value must be specified to indicate the LUTs logical function. The INIT value is calculated by assigning a 1 to the corresponding INIT bit value when the associated inputs are applied. For instance, a Verilog INIT value of 32'h80000000 (X"80000000" for VHDL) makes the output zero unless all of the inputs are one (a 5-input AND gate). A Verilog INIT value of 32'hffffffe (X"FFFFFFFE" for VHDL) makes the output one unless all zeros are on the inputs (a 5-input OR gate).

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

The Logic Table Method -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary truth table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.

The Equation Method -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed logic value and use those to build the logic equation you are after. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

| Inputs | | | | | Outputs |
|--------|----|----|----|----|---------|
| I4 | I3 | I2 | I1 | I0 | LO |
| 0 | 0 | 0 | 0 | 0 | INIT[0] |
| 0 | 0 | 0 | 0 | 1 | INIT[1] |
| 0 | 0 | 0 | 1 | 0 | INIT[2] |
| 0 | 0 | 0 | 1 | 1 | INIT[3] |
| 0 | 0 | 1 | 0 | 0 | INIT[4] |
| 0 | 0 | 1 | 0 | 1 | INIT[5] |

| Inputs | | | | | Outputs |

LUT6

Primitive: 6-Input Lookup Table with General Output

X10949

Introduction

This design element is a 6-input, 1-output look-up table (LUT) that can either act as an asynchronous 64-bit ROM (with 6-bit addressing) or implement any 6-input logic function. LUTs are the basic logic building blocks and are used to implement most logic functions of the design. A LUT6 is mapped to one of the four look-up tables in the slice. The functionality of the LUT6, LUT6_L and LUT6_D is the same. However, the LUT6_L and LUT6_D allow the additional specification to connect the LUT6 output signal to an internal slice, or CLB connection, using the LO output. The LUT6_L specifies that the only connections from the LUT6 will be within a slice, or CLB, while the LUT6_D allows the specification to connect the output of the LUT to both inter-slice/CLB logic and external logic as well. The LUT6 does not state any specific output connections and should be used in all cases except where internal slice or CLB signal connections must be implicitly specified.

An INIT attribute consisting of a 64-bit Hexadecimal value must be specified to indicate the LUTs logical function. The INIT value is calculated by assigning a 1 to corresponding INIT bit value when the associated inputs are applied. For instance, a Verilog INIT value of 64'h8000000000000000 (X"8000000000000000" for VHDL) makes the output zero unless all of the inputs are one (a 6-input AND gate). A Verilog INIT value of 64'hffffffffffffff (X"FFFFFFFFFFFFFFFF" for VHDL) makes the output one unless all zeros are on the inputs (a 6-input OR gate).

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

The Logic Table Method -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.

The Equation Method -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation you are after. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

| Inputs | | | | | | Outputs |
|--------|----|----|----|----|----|---------|
| I5 | I4 | I3 | I2 | I1 | I0 | O |
| 0 | 0 | 0 | 0 | 0 | 0 | INIT[0] |

| 1 | 1 | 1 | 1 | 1 | 0 | INIT[62] |
| 1 | 1 | 1 | 1 | 1 | 1 | INIT[63] |

INIT = Binary equivalent of the hexadecimal number assigned to the INIT attribute

Port Description

| Name | Direction | Width | Function |
|------------------------|-----------|-------|----------------|
| O | Output | 1 | 6/5-LUT output |
| I0, I1, I2, I3, I4, I5 | Input | 1 | LUT inputs |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|------------------|-----------|---|
| INIT | Hexadecimal | Any 64-Bit Value | All zeros | Specifies the logic value for the look-up tables. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- LUT6: 6-input Look-Up Table with general output
--      7 Series
-- Xilinx HDL Libraries Guide, version 14.7

LUT6_inst : LUT6
generic map (
  INIT => X"0000000000000000") -- Specify LUT Contents
port map (
  O => O, -- LUT general output
  I0 => I0, -- LUT input
  I1 => I1, -- LUT input
  I2 => I2, -- LUT input
  I3 => I3, -- LUT input
  I4 => I4, -- LUT input
  I5 => I5 -- LUT input
);

-- End of LUT6_inst instantiation
```

Verilog Instantiation Template

```
// LUT6: 6-input Look-Up Table with general output
//      7 Series
// Xilinx HDL Libraries Guide, version 14.7

LUT6 #(
  .INIT(64'h0000000000000000) // Specify LUT Contents
) LUT6_inst (
  .O(O), // LUT general output
  .I0(I0), // LUT input
  .I1(I1), // LUT input
  .I2(I2), // LUT input
  .I3(I3), // LUT input
  .I4(I4), // LUT input
  .I5(I5) // LUT input
);

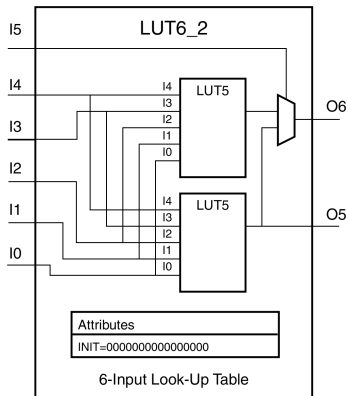

// End of LUT6_inst instantiation
```

LUT6_2

Primitive: Six-input, 2-output, Look-Up Table

Introduction

This design element is a 6-input, 2-output look-up table (LUT) that can either act as a dual asynchronous 32-bit ROM (with 5-bit addressing), implement any two 5-input logic functions with shared inputs, or implement a 6-input logic function and a 5-input logic function with shared inputs and shared logic values. LUTs are the basic logic building blocks and are used to implement most logic functions of the design. A LUT6_2 will be mapped to one of the four look-up tables in the slice.

An INIT attribute consisting of a 64-bit hexadecimal value must be specified to indicate the LUTs logical function. The INIT value is calculated by assigning a 1 to corresponding INIT bit value when the associated inputs are applied. For instance, a Verilog INIT value of 64'hffffffffffffe (X"FFFFFFFFFFFFFFFE" for VHDL) makes the O6 output 1 unless all zeros are on the inputs and the O5 output a 1, or unless I[4:0] are all zeroes (a 5-input and 6-input OR gate). The lower half (bits 31:0) of the INIT values apply to the logic function of the O5 output.

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

The Logic Table Method -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.

The Equation Method -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation you are after. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

| Inputs | | | | | | Outputs | |
|--------|----|----|----|----|----|---------|---------|
| I5 | I4 | I3 | I2 | I1 | I0 | O5 | O6 |
| 0 | 0 | 0 | 0 | 0 | 0 | INIT[0] | INIT[0] |

LUT6_D

Primitive: 6-Input Lookup Table with General and Local Outputs

X10947

Introduction

This design element is a six-input, one-output look-up table (LUT) that can either act as an asynchronous 64-bit ROM (with 6-bit addressing) or implement any 6-input logic function. LUTs are the basic logic building blocks and are used to implement most logic functions of the design. A LUT6 is mapped to one of the four look-up tables in the slice. The functionality of the LUT6, LUT6_L and LUT6_D is the same. However, the LUT6_L and LUT6_D allow the additional specification to connect the LUT6 output signal to an internal slice, or CLB connection, using the LO output. The LUT6_L specifies that the only connections from the LUT6 will be within a slice, or CLB, while the LUT6_D allows the specification to connect the output of the LUT to both inter-slice/CLB logic and external logic as well. The LUT6 does not state any specific output connections and should be used in all cases except where internal slice or CLB signal connections must be implicitly specified.

An INIT attribute consisting of a 64-bit Hexadecimal value must be specified to indicate the LUTs logical function. The INIT value is calculated by assigning a 1 to corresponding INIT bit value when the associated inputs are applied. For instance, a Verilog INIT value of 64'h8000000000000000 (X"8000000000000000" for VHDL) makes the output zero unless all of the inputs are one (a 6-input AND gate). A Verilog INIT value of 64'hffffffffffff (X"FFFFFFFFFFFFFFFF" for VHDL) makes the output one unless all zeros are on the inputs (a 6-input OR gate).

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

- **The Logic Table Method** -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary logic table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.
- **The Equation Method** -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

| Inputs | | | | | | Outputs | |
|--------|----|----|----|----|----|---------|---------|
| I5 | I4 | I3 | I2 | I1 | I0 | O | LO |

INIT = Binary equivalent of the hexadecimal number assigned to the INIT attribute

Port Description

| Name | Direction | Width | Function |
|------------------------|-----------|-------|----------------|
| O6 | Output | 1 | 6/5-LUT output |
| O5 | Output | 1 | 5-LUT output |
| I0, I1, I2, I3, I4, I5 | Input | 1 | LUT inputs |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|------------------|-----------|---|
| INIT | Hexadecimal | Any 64-Bit Value | All zeros | Specifies the logic value for the look-up tables. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- LUT6_D: 6-input Look-Up Table with general and local outputs
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

LUT6_D_inst : LUT6_D
generic map (
  INIT => X"0000000000000000") -- Specify LUT contents
port map (
  LO => LO, -- LUT local output
  O => O, -- LUT general output
  I0 => I0, -- LUT input
  I1 => I1, -- LUT input
  I2 => I2, -- LUT input
  I3 => I3, -- LUT input
  I4 => I4, -- LUT input
  I5 => I5 -- LUT input
);

-- End of LUT6_D_inst instantiation
```

Verilog Instantiation Template

```
// LUT6_D: 6-input Look-Up Table with general and local outputs
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

LUT6_D #(
  .INIT(64'h0000000000000000) // Specify LUT Contents
) LUT6_D_inst (
  .LO(LO), // LUT local output
  .O(O), // LUT general output
  .I0(I0), // LUT input
  .I1(I1), // LUT input
  .I2(I2), // LUT input
  .I3(I3), // LUT input
  .I4(I4), // LUT input
  .I5(I5) // LUT input
);

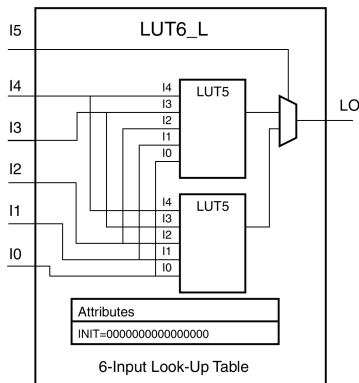

// End of LUT6_D_inst instantiation
```

LUT6_L

Primitive: 6-Input Lookup Table with Local Output

X10948

Introduction

This design element is a 6-input, 1-output look-up table (LUT) that can either act as an asynchronous 64-bit ROM (with 6-bit addressing) or implement any 6-input logic function. LUTs are the basic logic building blocks and are used to implement most logic functions of the design. A LUT6 is mapped to one of the four look-up tables in the slice. The functionality of the LUT6, LUT6_L and LUT6_D is the same. However, the LUT6_L and LUT6_D allow the additional specification to connect the LUT6 output signal to an internal slice, or CLB, connection, using the LO output. The LUT6_L specifies that the only connections from the LUT6 are within a slice, or CLB, while the LUT6_D allows the specification to connect the output of the LUT to both inter-slice/CLB logic and external logic as well. The LUT6 does not state any specific output connections and should be used in all cases except where internal slice or CLB signal connections must be implicitly specified.

An INIT attribute consisting of a 64-bit hexadecimal value must be specified to indicate the LUT's logical function. The INIT value is calculated by assigning a 1 to the corresponding INIT bit value when the associated inputs are applied. For instance, a Verilog INIT value of `64'h8000000000000000` (`X"8000000000000000"` for VHDL) will make the output zero unless all of the inputs are one (a 6-input AND gate). A Verilog INIT value of `64'hffffffffffff` (`X"FFFFFFFFFFFFFFFF"` for VHDL) will make the output one unless all zeros are on the inputs (a 6-input OR gate).

The INIT parameter for the FPGA LUT primitive is what gives the LUT its logical value. By default, this value is zero, thus driving the output to a zero regardless of the input values (acting as a ground). However, in most cases a new INIT value must be determined in order to specify the logic function for the LUT primitive. There are at least two methods by which the LUT value can be determined:

The Logic Table Method -A common method to determine the desired INIT value for a LUT is using a logic table. To do so, simply create a binary truth table of all possible inputs, specify the desired logic value of the output and then create the INIT string from those output values.

The Equation Method -Another method to determine the LUT value is to define parameters for each input to the LUT that correspond to their listed truth value and use those to build the logic equation you are after. This method is easier to understand once you have grasped the concept and is more self-documenting than the above method. However, this method does require the code to first specify the appropriate parameters.

Logic Table

| Inputs | | | | | | Outputs |
|--------|----|----|----|----|----|---------|
| I5 | I4 | I3 | I2 | I1 | I0 | LO |
| 0 | 0 | 0 | 0 | 0 | 0 | INIT[0] |
| 0 | 0 | 0 | 0 | 0 | 1 | INIT[1] |

| Inputs | | | | | | Outputs |
|--------|----|----|----|----|----|----------|
| I5 | I4 | I3 | I2 | I1 | I0 | LO |
| 0 | 0 | 0 | 0 | 1 | 0 | INIT[2] |
| 0 | 0 | 0 | 0 | 1 | 1 | INIT[3] |
| 0 | 0 | 0 | 1 | 0 | 0 | INIT[4] |
| 0 | 0 | 0 | 1 | 0 | 1 | INIT[5] |
| 0 | 0 | 0 | 1 | 1 | 0 | INIT[6] |
| 0 | 0 | 0 | 1 | 1 | 1 | INIT[7] |
| 0 | 0 | 1 | 0 | 0 | 0 | INIT[8] |
| 0 | 0 | 1 | 0 | 0 | 1 | INIT[9] |
| 0 | 0 | 1 | 0 | 1 | 0 | INIT[10] |

| 0 | 0 | 1 | 1 | 0 | 0 | INIT[12] |
| 0 | 0 | 1 | 1 | 0 | 1 | INIT[13] |
| 0 | 0 | 1 | 1 | 1 | 0 | INIT[14] |
| 0 | 0 | 1 | 1 | 1 | 1 | INIT[15] |
| 0 | 1 | 0 | 0 | 0 | 0 | INIT[16] |
| 0 | 1 | 0 | 0 | 0 | 1 | INIT[17] |
| 0 | 1 | 0 | 0 | 1 | 0 | INIT[18] |
| 0 | 1 | 0 | 0 | 1 | 1 | INIT[19] |
| 0 | 1 | 0 | 1 | 0 | 0 | INIT[20] |
| 0 | 1 | 0 | 1 | 0 | 1 | INIT[21] |
| 0 | 1 | 0 | 1 | 1 | 0 | INIT[22] |
| 0 | 1 | 0 | 1 | 1 | 1 | INIT[23] |
| 0 | 1 | 1 | 0 | 0 | 0 | INIT[24] |
| 0 | 1 | 1 | 0 | 0 | 1 | INIT[25] |
| 0 | 1 | 1 | 0 | 1 | 0 | INIT[26] |
| 0 | 1 | 1 | 0 | 1 | 1 | INIT[27] |
| 0 | 1 | 1 | 1 | 0 | 0 | INIT[28] |
| 0 | 1 | 1 | 1 | 0 | 1 | INIT[29] |
| 0 | 1 | 1 | 1 | 1 | 0 | INIT[30] |
| 0 | 1 | 1 | 1 | 1 | 1 | INIT[31] |
| 1 | 0 | 0 | 0 | 0 | 0 | INIT[32] |
| 1 | 0 | 0 | 0 | 0 | 1 | INIT[33] |
| 1 | 0 | 0 | 0 | 1 | 0 | INIT[34] |
| 1 | 0 | 0 | 0 | 1 | 1 | INIT[35] |
| 1 | 0 | 0 | 1 | 0 | 0 | INIT[36] |
| 1 | 0 | 0 | 1 | 0 | 1 | INIT[37] |
| 1 | 0 | 0 | 1 | 1 | 0 | INIT[38] |

| Inputs | | | | | | Outputs |
|--------|----|----|----|----|----|----------|
| I5 | I4 | I3 | I2 | I1 | I0 | LO |
| 1 | 0 | 0 | 1 | 1 | 1 | INIT[39] |
| 1 | 0 | 1 | 0 | 0 | 0 | INIT[40] |
| 1 | 0 | 1 | 0 | 0 | 1 | INIT[41] |
| 1 | 0 | 1 | 0 | 1 | 0 | INIT[42] |
| 1 | 0 | 1 | 0 | 1 | 1 | INIT[43] |
| 1 | 0 | 1 | 1 | 0 | 0 | INIT[44] |
| 1 | 0 | 1 | 1 | 0 | 1 | INIT[45] |
| 1 | 0 | 1 | 1 | 1 | 0 | INIT[46] |
| 1 | 0 | 1 | 1 | 1 | 1 | INIT[47] |
| 1 | 1 | 0 | 0 | 0 | 0 | INIT[48] |
| 1 | 1 | 0 | 0 | 0 | 1 | INIT[49] |
| 1 | 1 | 0 | 0 | 1 | 0 | INIT[50] |
| 1 | 1 | 0 | 0 | 1 | 1 | INIT[51] |
| 1 | 1 | 0 | 1 | 0 | 0 | INIT[52] |
| 1 | 1 | 0 | 1 | 0 | 1 | INIT[53] |
| 1 | 1 | 0 | 1 | 1 | 0 | INIT[54] |
| 1 | 1 | 0 | 1 | 1 | 1 | INIT[55] |
| 1 | 1 | 1 | 0 | 0 | 0 | INIT[56] |
| 1 | 1 | 1 | 0 | 0 | 1 | INIT[57] |
| 1 | 1 | 1 | 0 | 1 | 0 | INIT[58] |
| 1 | 1 | 1 | 0 | 1 | 1 | INIT[59] |
| 1 | 1 | 1 | 1 | 0 | 0 | INIT[60] |
| 1 | 1 | 1 | 1 | 0 | 1 | INIT[61] |
| 1 | 1 | 1 | 1 | 1 | 0 | INIT[62] |
| 1 | 1 | 1 | 1 | 1 | 1 | INIT[63] |

INIT = Binary equivalent of the hexadecimal number assigned to the INIT attribute

Port Description

| Name | Direction | Width | Function |
|------------------------|-----------|-------|---|
| LO | Output | 1 | 6/5-LUT output or internal CLB connection |
| I0, I1, I2, I3, I4, I5 | Input | 1 | LUT inputs |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|------------------|-----------|---|
| INIT | Hexadecimal | Any 64-Bit Value | All zeros | Specifies the logic value for the look-up tables. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- LUT6_L: 6-input Look-Up Table with local output
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

LUT6_L_inst : LUT6_L
generic map (
  INIT => X"0000000000000000") -- Specify LUT Contents
port map (
  LO => LO, -- LUT local output
  I0 => I0, -- LUT input
  I1 => I1, -- LUT input
  I2 => I2, -- LUT input
  I3 => I3, -- LUT input
  I4 => I4, -- LUT input
  I5 => I5 -- LUT input
);

-- End of LUT6_L_inst instantiation
```

Verilog Instantiation Template

```
// LUT6_L: 6-input Look-Up Table with local output
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

LUT6_L #(
  .INIT(64'h0000000000000000) // Specify LUT Contents
) LUT6_L_inst (
  .LO(LO), // LUT local output
  .I0(I0), // LUT input
  .I1(I1), // LUT input
  .I2(I2), // LUT input
  .I3(I3), // LUT input
  .I4(I4), // LUT input
  .I5(I5) // LUT input
);

// End of LUT6_L_inst instantiation
```

MMCME2_ADV

Primitive: Advanced Mixed Mode Clock Manager

Introduction

The MMCME2 is a mixed signal block designed to support frequency synthesis, clock network deskew, and jitter reduction. The clock outputs can each have an individual divide, phase shift and duty cycle based on the same VCO frequency. Additionally, the MMCME2 supports dynamic phase shifting and fractional divides.

Port Descriptions

| Port | Type | Width | Function |
|--------------|--------|-------|--|
| CLKFBIN | Input | 1 | Feedback clock pin to the MMCM |
| CLKFBOUT | Output | 1 | Dedicated MMCM Feedback clock output |
| CLKFBOUTB | Output | 1 | Inverted CLKFBOUT |
| CLKFBSTOPPED | Output | 1 | Status pin indicating that the feedback clock has stopped. |
| CLKINSEL | Input | 1 | Signal controls the state of the input MUX, High = CLKIN1, Low = CLKIN2. |
| CLKINSTOPPED | Output | 1 | Status pin indicating that the input clock has stopped. |
| CLKIN1 | Input | 1 | Primary clock input. |
| CLKIN2 | Input | 1 | Secondary clock input to dynamically switch the MMCM reference clock. |
| CLKOUT0 | Output | 1 | CLKOUT0 output |
| CLKOUT0B | Output | 1 | Inverted CLKOUT0 output |
| CLKOUT1 | Output | 1 | CLKOUT1 output |

| Port | Type | Width | Function |
|------------|--------|-------|---|
| CLKOUT1B | Output | 1 | Inverted CLKOUT1 output |
| CLKOUT2 | Output | 1 | CLKOUT2 output |
| CLKOUT2B | Output | 1 | Inverted CLKOUT2 output |
| CLKOUT3 | Output | 1 | CLKOUT3 output |
| CLKOUT3B | Output | 1 | Inverted CLKOUT3 output |
| CLKOUT4 | Output | 1 | CLKOUT4 output |
| CLKOUT5 | Output | 1 | CLKOUT5 output |
| CLKOUT6 | Output | 1 | CLKOUT6 output |
| DADDR<6:0> | Input | 7 | The dynamic reconfiguration address (DADDR) input bus provides a reconfiguration address for the dynamic reconfiguration. When not used, all bits must be assigned zeros. |
| DCLK | Input | 1 | The DCLK signal is the reference clock for the dynamic reconfiguration port. |
| DEN | Input | 1 | The dynamic reconfiguration enable (DEN) provides the enable control signal to access the dynamic reconfiguration feature. When the dynamic reconfiguration feature is not used, DEN must be tied Low. |
| DI<15:0> | Input | 16 | The dynamic reconfiguration data input (DI) bus provides reconfiguration data. When not used, all bits must be set to zero. |
| DO<15:0> | Output | 16 | The dynamic reconfiguration output bus provides MMCM data output when using dynamic reconfiguration. |
| DRDY | Output | 1 | The dynamic reconfiguration ready output (DRDY) provides the response to the DEN signal for the MMCMs dynamic reconfiguration feature. |
| DWE | Input | 1 | The dynamic reconfiguration write enable (DWE) input pin provides the write enable control signal to write the DI data into the DADDR address. When not used, it must be tied Low. |
| LOCKED | Output | 1 | An output from the MMCM that indicates when the MMCM has achieved phase alignment within a predefined window and frequency matching within a predefined PPM range. The MMCM automatically locks after power on, no extra reset is required. LOCKED will be deasserted if the input clock stops or the phase alignment is violated (e.g., input clock phase shift). The MMCM automatically reacquires lock after LOCKED is deasserted. |
| PSCLK | Input | 1 | Phase shift clock. |
| PSDONE | Output | 1 | Phase shift done. |
| PSEN | Input | 1 | Phase shift enable |
| PSINCDEC | Input | 1 | Phase shift increment/decrement control. |
| PWRDWN | Input | 1 | Powers down instantiated but unused MMCMs. |
| RST | Input | 1 | Asynchronous reset signal. The MMCM will synchronously re-enable itself when this signal is released (i.e., MMCM re-enabled). A reset is required when the input clock conditions change (e.g., frequency). |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Recommended |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|---|---------------------------|-------------------------------|-------------|--|
| BANDWIDTH | STRING | "OPTIMIZED", "HIGH", "LOW" | "OPTIMIZED" | Specifies the MMCM programming algorithm affecting the jitter, phase margin and other characteristics of the MMCM. |
| CLKFBOUT_MULT_F | 3 significant digit FLOAT | 2.000 to 64.000 | 5.000 | Specifies the amount to multiply all CLKOUT clock outputs if a different frequency is desired. This number, in combination with the associated CLKOUT#_DIVIDE value and DIVCLK_DIVIDE value, will determine the output frequency. |
| CLKFBOUT_PHASE | 3 significant digit FLOAT | -360.000 to 360.000 | 0.000 | Specifies the phase offset in degrees of the clock feedback output. Shifting the feedback clock results in a negative phase shift of all output clocks to the MMCM. |
| CLKIN1_PERIOD, CLKIN2_PERIOD | FLOAT(nS) | 0.000 to 100.000 | 0.000 | Specifies the input period in ns to the MMCM CLKIN inputs. Resolution is down to the ps. For example a value of 33.333 would indicate a 30 MHz input clock. This information is mandatory and must be supplied. CLKIN1_PERIOD relates to the input period on the CLKIN1 input while CLKIN2_PERIOD relates to the input clock period on the CLKIN2 input. |
| CLKOUT1_DIVIDE, CLKOUT2_DIVIDE, CLKOUT3_DIVIDE, CLKOUT4_DIVIDE, CLKOUT5_DIVIDE, CLKOUT6_DIVIDE | DECIMAL | 1 to 128 | 1 | Specifies the amount to divide the associated CLKOUT clock output if a different frequency is desired. This number in combination with the CLKFBOUT_MULT_F and DIVCLK_DIVIDE values will determine the output frequency. |
| CLKOUT0_DIVIDE_F | 3 significant digit FLOAT | 1.000 to 128.000 | 1.000 | Specifies the amount to divide the associated CLKOUT clock output if a different frequency is desired. This number in combination with the CLKFBOUT_MULT_F and DIVCLK_DIVIDE values will determine the output frequency. |
| CLKOUT0_DUTY_CYCLE to CLKOUT6_DUTY_CYCLE | 3 significant digit FLOAT | 0.001 to 0.999 | 0.500 | Specifies the Duty Cycle of the associated CLKOUT clock output in percentage (i.e., 0.50 will generate a 50% duty cycle). |
| CLKOUT0_PHASE to CLKOUT6_PHASE | 3 significant digit FLOAT | -360.000 to 360.000 | 0.000 | Specifies the phase offset in degrees of the clock feedback output. Shifting the feedback clock results in a negative phase shift of all output clocks to the MMCM. |

| Attribute | Type | Allowed Values | Default | Description |
|--|---------------------------|---|---------------|---|
| CLKOUT4_CASCADE | BOOLEAN | FALSE, TRUE | FALSE | Cascades the output divider (counter) into the input of the CLKOUT4 divider for an output clock divider that is greater than 128. |
| COMPENSATION | STRING | "ZHOLD", "BUF_IN", "EXTERNAL", "INTERNAL" | "ZHOLD" | <p>Clock input compensation. Should be set to ZHOLD. Defines how the MMCM feedback is configured.</p> <ul style="list-style-type: none"> "ZHOLD" - MMCM is configured to provide a negative hold time at the I/O registers. "INTERNAL" - MMCM is using its own internal feedback path so no delay is being compensated. "EXTERNAL" - a network external to the FPGA is being compensated. "BUF_IN" - configuration does not match with the other compensation modes and no delay will be compensated. This is the case if a clock input is driven by a BUFG/BUFH/BUFR/GT. |
| DIVCLK_DIVIDE | DECIMAL | 1 to 106 | 1 | Specifies the division ratio for all output clocks with respect to the input clock. Effectively divides the CLKIN going into the PFD. |
| REF_JITTER1, REF_JITTER2 | 3 significant digit FLOAT | 0.000 to 0.999 | 0.010 | Allows specification of the expected jitter on the CLKIN inputs in order to better optimize MMCM performance. A bandwidth setting of OPTIMIZED will attempt to choose the best parameter for input clocking when unknown. If known, then the value provided should be specified in terms of the UI percentage (the maximum peak to peak value) of the expected jitter on the input clock. REF_JITTER1 relates to the input jitter on CLKIN1 while REF_JITTER2 relates to the input jitter on CLKIN2. |
| SS_EN | STRING | "FALSE", "TRUE" | "FALSE" | Enables the spread spectrum feature for the MMCM. Used in conjunction with SS_MODE and SS_MOD_PERIOD attributes. |
| SS_MOD_PERIOD | DECIMAL(ns) | 4000 to 40000 | 10000 | Specifies the spread spectrum modulation period (ns). |
| SS_MODE | STRING | "CENTER_HIGH", "CENTER_LOW", "DOWN_HIGH", "DOWN_LOW" | "CENTER_HIGH" | Controls the spread spectrum frequency deviation and the spread type. |
| STARTUP_WAIT | BOOLEAN | FALSE, TRUE | FALSE | Delays configuration DONE signal from asserting until MMCM is locked. |
| CLKFBOUT_USE_FINE_PS to CLKOUT6_USE_FINE_PS | BOOLEAN | FALSE, TRUE | FALSE | Counter variable fine phase shift enable. |

VHDL Instantiation Template

MMCME2_BASE

Primitive: Base Mixed Mode Clock Manager

Introduction

The MMCME2 is a mixed signal block designed to support frequency synthesis, clock network deskew, and jitter reduction. The clock outputs can each have an individual divide, phase shift and duty cycle based on the same VCO frequency. Additionally, the MMCME2 supports dynamic phase shifting and fractional divides.

Port Descriptions

| Port | Type | Width | Function |
|-----------|--------|-------|--------------------------------------|
| CLKFBIN | Input | 1 | Feedback clock pin to the MMCM |
| CLKFBOUT | Output | 1 | Dedicated MMCM Feedback clock output |
| CLKFBOUTB | Output | 1 | Inverted CLKFBOUT output |
| CLKOUT0 | Output | 1 | CLKOUT0 output |
| CLKOUT0B | Output | 1 | Inverted CLKOUT0 output |
| CLKOUT1 | Output | 1 | CLKOUT1 output |
| CLKOUT1B | Output | 1 | Inverted CLKOUT1 output |
| CLKOUT2 | Output | 1 | CLKOUT2 output |
| CLKOUT2B | Output | 1 | Inverted CLKOUT2 output |
| CLKOUT3 | Output | 1 | CLKOUT3 output |
| CLKOUT3B | Output | 1 | Inverted CLKOUT3 output |

| Port | Type | Width | Function |
|--------------|--------|-------|---|
| CLKOUT4 | Output | 1 | CLKOUT4 output |
| CLKOUT5 | Output | 1 | CLKOUT5 output |
| CLKOUT6 | Output | 1 | CLKOUT6 output |
| Clock Inputs | Input | 1 | General clock input. |
| PWRDWN | Input | 1 | Powers down instantiated but unused MMCMs. |
| RST | Input | 1 | Asynchronous reset signal. The MMCM will synchronously re-enable itself when this signal is released (i.e., MMCM re-enabled). A reset is required when the input clock conditions change (e.g., frequency). |
| Status Ports | Output | 1 | An output from the MMCM that indicates when the MMCM has achieved phase alignment within a predefined window and frequency matching within a predefined PPM range. The MMCM automatically locks after power on, no extra reset is required. LOCKED will be deasserted if the input clock stops or the phase alignment is violated (e.g., input clock phase shift). The MMCM automatically reacquires lock after LOCKED is deasserted. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Recommended |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|-----------------|------------------------------|----------------------------|-------------|---|
| BANDWIDTH | STRING | "OPTIMIZED", "HIGH", "LOW" | "OPTIMIZED" | Specifies the MMCM programming algorithm affecting the jitter, phase margin and other characteristics of the MMCM. |
| CLKFBOUT_MULT_F | 3 significant digit FLOAT | 2.000 to 64.000 | 5.000 | Specifies the amount to multiply all CLKOUT clock outputs if a different frequency is desired. This number, in combination with the associated CLKOUT#_DIVIDE value and DIVCLK_DIVIDE value, will determine the output frequency. |
| CLKFBOUT_PHASE | 3 significant digit FLOAT | -360.000 to 360.000 | 0.000 | Specifies the phase offset in degrees of the clock feedback output. Shifting the feedback clock results in a negative phase shift of all output clocks to the MMCM. |
| CLKIN1_PERIOD | FLOAT(ns) | 0.000 to 100.000 | 0.000 | Specifies the input period in ns to the MMCM CLKIN1 input. Resolution is down to the ps (3 decimal places). For example, a value of 33.333 would indicate a 30 MHz input clock. This information is mandatory and must be supplied. |

| Attribute | Type | Allowed Values | Default | Description |
|---|------------------------------|------------------------|---------|---|
| CLKOUT1_DIVIDE, CLKOUT2_DIVIDE, CLKOUT3_DIVIDE, CLKOUT4_DIVIDE, CLKOUT5_DIVIDE, CLKOUT6_DIVIDE | DECIMAL | 1 to 128 | 1 | Specifies the amount to divide the associated CLKOUT clock output if a different frequency is desired. This number in combination with the CLKFBOUT_MULT_F and DIVCLK_DIVIDE values will determine the output frequency. |
| CLKOUT0_DIVIDE_F | 3 significant digit FLOAT | 1.000 to 128.000 | 1.000 | Specifies the amount to divide the associated CLKOUT clock output if a different frequency is desired. This number in combination with the CLKFBOUT_MULT_F and DIVCLK_DIVIDE values will determine the output frequency. |
| CLKOUT0_DUTY_CYCLE to CLKOUT6_DUTY_CYCLE | 3 significant digit FLOAT | 0.001 to 0.999 | 0.500 | Specifies the Duty Cycle of the associated CLKOUT clock output in percentage (i.e., 0.50 will generate a 50% duty cycle). |
| CLKOUT0_PHASE to CLKOUT6_PHASE | 3 significant digit FLOAT | -360.000 to 360.000 | 0.000 | Specifies the phase offset in degrees of the clock feedback output. Shifting the feedback clock results in a negative phase shift of all output clocks to the MMCM. |
| CLKOUT4_CASCADE | BOOLEAN | FALSE, TRUE | FALSE | Cascades the output divider (counter) CLKOUT6 into the input of the CLKOUT4 divider for an output clock divider that is greater than 128. |
| DIVCLK_DIVIDE | DECIMAL | 1 to 106 | 1 | Specifies the division ratio for all output clocks with respect to the input clock. Effectively divides the CLKIN going into the PFD. |
| REF_JITTER1 | 3 significant digit FLOAT | 0.000 to 0.999 | 0.010 | Allows specification of the expected jitter on CLKIN1 in order to better optimize MMCM performance. A bandwidth setting of OPTIMIZED will attempt to choose the best parameter for input clocking when unknown. If known, then the value provided should be specified in terms of the UI percentage (the maximum peak to peak value) of the expected jitter on the input clock. |
| STARTUP_WAIT | BOOLEAN | FALSE, TRUE | FALSE | Delays configuration DONE signal from asserting until MMCM is locked. |

MUXF7

Primitive: 2-to-1 Look-Up Table Multiplexer with General Output

Introduction

This design element is a two input multiplexer which, in combination with two LUT6 elements will let you create any 7-input function, an 8-to-1 multiplexer, or other logic functions up to 12-bits wide. Local outputs of the LUT6 element are connected to the I0 and I1 inputs of the MUXF7. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

The O output is a general interconnect.

The variants, "MUXF7_D" and "MUXF7_L", provide additional types of outputs that can be used by different timing models for more accurate pre-layout timing estimation.

Logic Table

| Inputs | | | Outputs |
|--------|----|----|---------|
| S | I0 | I1 | O |
| 0 | I0 | X | I0 |
| 1 | X | I1 | I1 |
| X | 0 | 0 | 0 |
| X | 1 | 1 | 1 |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|-----------------------------------|
| O | Output | 1 | Output of MUX to general routing. |
| I0 | Input | 1 | Input (tie to LUT6 LO out). |
| I1 | Input | 1 | Input (tie to LUT6 LO out). |
| S | Input | 1 | Input select to MUX. |

MUXF7_D

Primitive: 2-to-1 Look-Up Table Multiplexer with Dual Output

Introduction

This design element is a two input multiplexer which, in combination with two LUT6 elements will let you create any 7-input function, an 8-to-1 multiplexer, or other logic functions up to 12-bits wide. Local outputs of the LUT6 element are connected to the I0 and I1 inputs of the MUXF7. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

Outputs O and LO are functionally identical. The O output is a general interconnect. The LO output connects to other inputs in the same CLB slice.

See also "MUXF7" and "MUXF7_L".

Logic Table

| Inputs | | | Outputs | |
|--------|----|----|---------|----|
| S | I0 | I1 | O | LO |
| 0 | I0 | X | I0 | I0 |
| 1 | X | I1 | I1 | I1 |
| X | 0 | 0 | 0 | 0 |
| X | 1 | 1 | 1 | 1 |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|-----------------------------------|
| O | Output | 1 | Output of MUX to general routing. |
| LO | Output | 1 | Output of MUX to local routing. |
| I0 | Input | 1 | Input (tie to LUT6 LO out). |
| I1 | Input | 1 | Input (tie to LUT6 LO out). |
| S | Input | 1 | Input select to MUX. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- MUXF7_D: CLB MUX to tie two LUT6's together with general and local outputs
--           7 Series
-- Xilinx HDL Libraries Guide, version 14.7

MUXF7_D_inst : MUXF7_D
port map (
    LO => LO,  -- Output of MUX to local routing
    O => O,    -- Output of MUX to general routing
    IO => IO,  -- Input (tie to LUT6 O6 pin)
    I1 => I1,  -- Input (tie to LUT6 O6 pin)
    S => S    -- Input select to MUX
);

-- End of MUXF7_D_inst instantiation
```

Verilog Instantiation Template

```
// MUXF7_D: CLB MUX to tie two LUT6's together with general and local outputs
//           7 Series
// Xilinx HDL Libraries Guide, version 14.7

MUXF7_D MUXF7_D_inst (
    .LO(LO), // Output of MUX to local routing
    .O(O),  // Output of MUX to general routing
    .IO(IO), // Input (tie to LUT6 O6 pin)
    .I1(I1), // Input (tie to LUT6 O6 pin)
    .S(S)   // Input select to MUX
);

// End of MUXF7_D_inst instantiation
```

MUXF7_L

Primitive: 2-to-1 look-up table Multiplexer with Local Output

Introduction

This design element is a two input multiplexer which, in combination with two LUT6 elements will let you create any 7-input function, an 8-to-1 multiplexer, or other logic functions up to 12-bits wide. Local outputs of the LUT6 element are connected to the I0 and I1 inputs of the MUXF7. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

The LO output connects to other inputs in the same CLB slice.

See also "MUXF7" and "MUXF7_D".

Logic Table

| Inputs | | | Output |
|--------|----|----|--------|
| S | I0 | I1 | LO |
| 0 | I0 | X | I0 |
| 1 | X | I1 | I1 |
| X | 0 | 0 | 0 |
| X | 1 | 1 | 1 |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--------------------------------|
| LO | Output | 1 | Output of MUX to local routing |
| I0 | Input | 1 | Input |
| I1 | Input | 1 | Input |
| S | Input | 1 | Input select to MUX |

Design Entry Method

MUXF8

Primitive: 2-to-1 Look-Up Table Multiplexer with General Output

Introduction

This design element is a two input multiplexer which, in combination with two MUXF7 multiplexers and their four associated LUT6 elements, will let you create any 8-input function, a 16-to-1 multiplexer, or other logic functions up to 24-bits wide. Local outputs of MUXF7 are connected to the I0 and I1 inputs of the MUXF8. The S input is driven from any internal net. When Low, S selects I0. When High, S selects I1.

The O output is a general interconnect.

The variants, "MUXF8_D" and "MUXF8_L", provide additional types of outputs that can be used by different timing models for more accurate pre-layout timing estimation.

Logic Table

| Inputs | | | Outputs |
|--------|----|----|---------|
| S | I0 | I1 | O |
| 0 | I0 | X | I0 |
| 1 | X | I1 | I1 |
| X | 0 | 0 | 0 |
| X | 1 | 1 | 1 |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|----------------------------------|
| O | Output | 1 | Output of MUX to general routing |
| I0 | Input | 1 | Input (tie to MUXF7 LO out) |
| I1 | Input | 1 | Input (tie to MUXF7 LO out) |
| S | Input | 1 | Input select to MUX |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

VHDL Instantiation Template

OBUF

Primitive: Output Buffer

Introduction

This design element is a simple output buffer used to drive output signals to the FPGA device pins that do not need to be 3-stated (constantly driven). Either an OBUF, OBUFT, OBUFDS, or OBUFTDS must be connected to every output port in the design.

This element isolates the internal circuit and provides drive current for signals leaving a chip. It exists in input/output blocks (IOB). Its output (O) is connected to an OPAD or an IOPAD. The interface standard used by this element is LVCMOS18. Also, this element has selectable drive and slew rates using the DRIVE and SLOW or FAST constraints.

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|---|
| O | Output | 1 | Output of OBUF to be connected directly to top-level output port. |
| I | Input | 1 | Input of OBUF. Connect to the logic driving the output port. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|------------|-----------|------------------------|-----------|---|
| DRIVE | Integer | 2, 4, 6, 8, 12, 16, 24 | 12 | Specifies the output current drive strength of the I/O. It is suggested that you set this to the lowest setting tolerable for the design drive and timing requirements. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| SLEW | String | "SLOW" or "FAST" | "SLOW" | Specifies the slew rate of the output driver. Consult the product Data Sheet for recommendations of the best setting for this attribute. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- OBUF: Single-ended Output Buffer
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

OBUF_inst : OBUF
generic map (
    DRIVE => 12,
    IOSTANDARD => "DEFAULT",
    SLEW => "SLOW")
port map (
    O => O,      -- Buffer output (connect directly to top-level port)
    I => I       -- Buffer input
);

-- End of OBUF_inst instantiation
```

Verilog Instantiation Template

```
// OBUF: Single-ended Output Buffer
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

OBUF #(
    .DRIVE(12), // Specify the output drive strength
    .IOSTANDARD("DEFAULT"), // Specify the output I/O standard
    .SLEW("SLOW") // Specify the output slew rate
) OBUF_inst (
    .O(O), // Buffer output (connect directly to top-level port)
    .I(I) // Buffer input
);

// End of OBUF_inst instantiation
```

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

OBUFDS

Primitive: Differential Signaling Output Buffer

Introduction

This design element is a single output buffer that supports low-voltage, differential signaling. OBUFDS isolates the internal circuit and provides drive current for signals leaving the chip. Its output is represented as two distinct ports (O and OB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET and MYNETB).

Logic Table

| Inputs | Outputs | |
|--------|---------|----|
| I | O | OB |
| 0 | 0 | 1 |
| 1 | 1 | 0 |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| O | Output | 1 | Diff_p output (connect directly to top level port) |
| OB | Output | 1 | Diff_n output (connect directly to top level port) |
| I | Input | 1 | Buffer input |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|------------|-----------|------------------|-----------|--|
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| SLEW | String | "SLOW" or "FAST" | "SLOW" | Specifies the slew rate of the output driver. Consult the product Data Sheet for recommendations of the best setting for this attribute. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- OBUFDS: Differential Output Buffer
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

OBUFDS_inst : OBUFDS
generic map (
  IOSTANDARD => "DEFAULT", -- Specify the output I/O standard
  SLEW => "SLOW")         -- Specify the output slew rate
port map (
  O => O,      -- Diff_p output (connect directly to top-level port)
  OB => OB,    -- Diff_n output (connect directly to top-level port)
  I => I       -- Buffer input
);

-- End of OBUFDS_inst instantiation
```

Verilog Instantiation Template

```
// OBUFDS: Differential Output Buffer
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

OBUFDS #(
  .IOSTANDARD("DEFAULT"), // Specify the output I/O standard
  .SLEW("SLOW")           // Specify the output slew rate
) OBUFDS_inst (
  .O(O), // Diff_p output (connect directly to top-level port)
  .OB(OB), // Diff_n output (connect directly to top-level port)
  .I(I) // Buffer input
);

// End of OBUFDS_inst instantiation
```

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

OBUFT

Primitive: 3-State Output Buffer with Active Low Output Enable

Introduction

This design element is a single, 3-state output buffer with input I, output O, and active-Low output enables (T). This element uses the LVCMOS18 standard and has selectable drive and slew rates using the DRIVE and SLOW or FAST constraints.

When T is Low, data on the inputs of the buffers is transferred to the corresponding outputs. When T is High, the output is high impedance (off or Z state). OBUFTs are generally used when a single-ended output is needed with a 3-state capability, such as the case when building bidirectional I/O.

Logic Table

| Inputs | | Outputs |
|--------|---|---------|
| T | I | O |
| 1 | X | Z |
| 0 | 1 | 1 |
| 0 | 0 | 0 |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| O | Output | 1 | Buffer output (connect directly to top-level port) |
| I | Input | 1 | Buffer input |
| T | Input | 1 | 3-state enable input |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|------------|-----------|------------------------|-----------|---|
| DRIVE | Integer | 2, 4, 6, 8, 12, 16, 24 | 12 | Specifies the output current drive strength of the I/O. It is suggested that you set this to the lowest setting tolerable for the design drive and timing requirements. |
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| SLEW | String | "SLOW" or "FAST" | "SLOW" | Specifies the slew rate of the output driver. See the Data Sheet for recommendations of the best setting for this attribute. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- OBUFT: Single-ended 3-state Output Buffer
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

OBUFT_inst : OBUFT
generic map (
  DRIVE => 12,
  IOSTANDARD => "DEFAULT",
  SLEW => "SLOW")
port map (
  O => O,      -- Buffer output (connect directly to top-level port)
  I => I,      -- Buffer input
  T => T       -- 3-state enable input
);

-- End of OBUFT_inst instantiation
```

Verilog Instantiation Template

```
// OBUFT: Single-ended 3-state Output Buffer
//       All devices
// Xilinx HDL Libraries Guide, version 14.7

OBUFT #(
  .DRIVE(12),    // Specify the output drive strength
  .IOSTANDARD("DEFAULT"), // Specify the output I/O standard
  .SLEW("SLOW") // Specify the output slew rate
) OBUFT_inst (
  .O(O),        // Buffer output (connect directly to top-level port)
  .I(I),        // Buffer input
  .T(T)         // 3-state enable input
);

// End of OBUFT_inst instantiation
```

For More Information

See the [7 Series FPGA User Documentation \(User Guides and Data Sheets\)](#).

OBUFTDS

Primitive: 3-State Output Buffer with Differential Signaling, Active-Low Output Enable

Introduction

This design element is an output buffer that supports low-voltage, differential signaling. For the OBUFTDS, a design level interface signal is represented as two distinct ports (O and OB), one deemed the "master" and the other the "slave." The master and the slave are opposite phases of the same logical signal (for example, MYNET_P and MYNET_N).

Logic Table

| Inputs | | Outputs | |
|--------|---|---------|----|
| I | T | O | OB |
| X | 1 | Z | Z |
| 0 | 0 | 0 | 1 |
| 1 | 0 | 1 | 0 |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| O | Output | 1 | Diff_p output (connect directly to top level port) |
| OB | Output | 1 | Diff_n output (connect directly to top level port) |
| I | Input | 1 | Buffer input |
| T | Input | 1 | 3-state enable input |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|------------|-----------|------------------|-----------|--|
| IOSTANDARD | String | See Data Sheet | "DEFAULT" | Assigns an I/O standard to the element. |
| SLEW | String | "SLOW" or "FAST" | "SLOW" | Specifies the slew rate of the output driver. Consult the product Data Sheet for recommendations of the best setting for this attribute. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

-- OBUFTDS: Differential 3-state Output Buffer
--       7 Series
-- Xilinx HDL Libraries Guide, version 14.7

OBUFTDS_inst : OBUFTDS
generic map (
  IOSTANDARD => "DEFAULT")
port map (
  O => O,      -- Diff_p output (connect directly to top-level port)
  OB => OB,    -- Diff_n output (connect directly to top-level port)
  I => I,      -- Buffer input
  T => T       -- 3-state enable input
);

-- End of OBUFTDS_inst instantiation
```

Verilog Instantiation Template

```
// OBUFTDS: Differential 3-state Output Buffer
//       7 Series
// Xilinx HDL Libraries Guide, version 14.7

OBUFTDS #(
  .IOSTANDARD("DEFAULT"), // Specify the output I/O standard
  .SLEW("SLOW")           // Specify the output slew rate
) OBUFTDS_inst (
  .O(O),      // Diff_p output (connect directly to top-level port)
  .OB(OB),    // Diff_n output (connect directly to top-level port)
  .I(I),      // Buffer input
  .T(T)       // 3-state enable input
);

// End of OBUFTDS_inst instantiation
```

For More Information

ODDR

Primitive: Dedicated Dual Data Rate (DDR) Output Register

Introduction

This design element is a dedicated output register for use in transmitting dual data rate (DDR) signals from FPGA devices. The ODDR interface with the FPGA fabric is not limited to opposite clock edges. It can be configured to present data from the FPGA fabric at the same clock edge. This feature allows designers to avoid additional timing complexities and CLB usage. The ODDR also works with SelectIO™ features.

ODDR Modes

This element has two modes of operation. These modes are set by the `DDR_CLK_EDGE` attribute.

- **OPPOSITE_EDGE mode** - The data transmit interface uses classic DDR methodology. Given a data and clock at pin D1-2 and C respectively, D1 is sampled at every positive edge of clock C and D2 is sampled at every negative edge of clock C. Q changes every clock edge.
- **SAME_EDGE mode** - Data is still transmitted at the output of the ODDR by opposite edges of clock C. However, the two inputs to the ODDR are clocked with a positive clock edge of clock signal C and an extra register is clocked with a negative clock edge of clock signal C. Using this feature, DDR data can now be presented into the ODDR at the same clock edge.

Port Descriptions

| Port | Direction | Width | Function |
|---------|-----------|----------|---|
| Q | Output | 1 | Data Output (DDR) - The ODDR output that connects to the IOB pad. |
| C | Input | 1 | Clock Input - The C pin represents the clock input pin. |
| CE | Input | 1 | Clock Enable Input - When asserted High, this port enables the clock input on port C. |
| D1 : D2 | Input | 1 (each) | Data Input - This pin is where the DDR data is presented into the ODDR module. |
| R | Input | 1 | Reset - Depends on how SRTYPE is set. |
| S | Input | 1 | Set - Active High asynchronous set pin. This pin can also be Synchronous depending on the SRTYPE attribute. |

ODELAYE2

Primitive: Output Fixed or Variable Delay Element

Introduction

This design element can be used to provide a fixed delay or an adjustable delay to the output path of the 7 series FPGA. This delay can be useful for the purpose of external data alignment, external phase offset and simultaneous switching noise (SSN) mitigation, as well as allowing for the tracking of external data alignment over process, temperature, and voltage (PVT). When used in conjunction with the IDELAYCTRL component circuitry, can provide precise time increments of delay. When used in variable mode, the output path can be adjusted for increasing and decreasing amounts of delay. The ODELAYE2 is not available on the High Range (HR) banks in the 7 series devices.

Port Descriptions

| Port | Type | Width | Function |
|-------------------|--------|-------|---|
| C | Input | 1 | All control inputs to ODELAYE2 primitive (CNTVALUEIN, RST, CE, LD, LDPIPEEN and INC) are synchronous to the clock input (C). A clock must be connected to this port when the ODELAYE2 is configured in "VARIABLE", "VAR_LOAD" or "VAR_LOAD_PIPE" mode. C can be locally inverted, and must be supplied by a global or regional clock buffer. This clock should be connected to the same clock in the SelectIO logic resources (when using OSERDESE2, C is connected to CLKDIV). If the ODELAYE2 is configured as "FIXED", connect this port to gnd. |
| CE | Input | 1 | Active high enable increment/decrement function. If the ODELAYE2 is configured as "FIXED", connect this port to gnd. |
| CINVCTRL | Input | 1 | The CINVCTRL pin is used for dynamically switching the polarity of C pin. This is for use in applications when glitches are not an issue. When switching the polarity, do not use the ODELAYE2 control pins for two clock cycles. If the ODELAYE2 is configured as "FIXED", connect this port to gnd. |
| CLKIN | Input | 1 | Delayed Clock input into the ODELAYE2. |
| CNTVALUEIN <4:0> | Input | 5 | Counter value from FPGA logic for dynamically loadable tap value input when configured in "VAR_LOAD" or "VAR_LOAD_PIPE" modes. If the ODELAYE2 is configured as "FIXED" or "VARIABLE", connect this port to gnd. |
| CNTVALUEOUT <4:0> | Output | 5 | The CNTVALUEOUT pins are used for reporting the dynamically switching value of the delay element. CNTVALUEOUT is only available when ODELAYE2 is in "VAR_LOAD" or "VAR_LOAD_PIPE" mode. |

| Port | Type | Width | Function |
|----------|--------|-------|--|
| DATAOUT | Output | 1 | Delayed data/clock from either the CLKIN or ODATAIN ports. DATAOUT connects to an I/O port in the case of data or back to the clocking structure in the case of a clock.. |
| INC | Input | 1 | The increment/decrement is controlled by the enable signal (CE). This interface is only available when ODELAYE2 is in VARIABLE, VAR_LOAD, or VAR_LOAD_PIPE mode. |
| LD | Input | 1 | Load initial value or loaded value to the counter. |
| LDPIPEEN | Input | 1 | Enable PIPELINE register to load data from LD pins. |
| ODATAIN | Input | 1 | The ODATAIN input is the output data to be delayed driven by the OSERDESE2 or output register. |
| REGRST | Input | 1 | The REGRST signal is an active-high reset and is synchronous to the input clock signal (C). When asserted, the tap value reverts to a zero state unless LDPIPEEN is also asserted in which case the tap value results in the value on the CNTVALUEIN port. |

Design Entry Method

| | |

| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|-----------------------|---------|---|-----------|---|
| CINVCTRL_SEL | STRING | "FALSE", "TRUE" | "FALSE" | Enables the CINVCTRL_SEL pin to dynamically switch the polarity of the C pin. |
| DELAY_SRC | STRING | "ODATAIN", "CLKIN" | "ODATAIN" | Select the data input source: <ul style="list-style-type: none"> "ODATAIN": ODELAYE2 chain input is ODATAIN "CLKIN": ODELAYE2 chain input is CLKIN |
| HIGH_PERFORMANCE_MODE | STRING | "FALSE", "TRUE" | "FALSE" | When TRUE, this attribute reduces the output jitter. When FALSE, power consumption is reduced. The difference in power consumption is quantified in the Xilinx Power Estimator tool. |
| ODELAY_TYPE | STRING | "FIXED", "VARIABLE", "VAR_LOAD", "VAR_LOAD_PIPE" | "FIXED" | Sets the type of tap delay line. <ul style="list-style-type: none"> "FIXED": Sets a static delay value "VARIABLE": Dynamically adjust (increment/decrement) delay value "VAR_LOAD": Dynamically loads tap values "VAR_LOAD_PIPE": Pipelined dynamically loadable tap values |
| ODELAY_VALUE | DECIMAL | 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, | 0 | Specifies the fixed number of delay taps in fixed mode or the |

| Attribute | Type | Allowed Values | Default | Description |
|------------------|---------------------------|--|---------|---|
| | | 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 | | initial starting number of taps in "VARIABLE" mode (output path). When IDELAY_TYPE is set to "VAR_LOAD" or "VAR_LOAD_PIPE" mode, this value is ignored. |
| PIPE_SEL | STRING | "FALSE", "TRUE" | "FALSE" | Select pipelined mode. |
| REFCLK_FREQUENCY | 1 significant digit FLOAT | 190.0 to 310.0 | 200.0 | Sets the tap value (in MHz) used by the Timing Analyzer for static timing analysis and functional/timing simulation. The frequency of REFCLK must be within the given datasheet range to guarantee the tap-delay value and performance. |
| SIGNAL_PATTERN | STRING | "DATA", "CLOCK" | "DATA" | Causes timing analysis to account for the appropriate amount of delay-chain jitter when presented with either a "DATA" pattern with irregular transitions or a "CLOCK" pattern with a regular rise/fall pattern. |

OSERDESE2

Primitive: Output SERIAL/DESerializer with bitslip

Introduction

The OSERDES in 7 series devices is a dedicated parallel-to-serial converter with specific clocking and logic resources designed to facilitate the implementation of high-speed source-synchronous interfaces. Every OSERDES module includes a dedicated serializer for data and 3-state control. Both data and 3-state serializers can be configured in single data rate (SDR) and double data rate (DDR) mode. Data serialization can be up to 8:1 (10:1 or 14:1 if using OSERDES Width Expansion). 3-state serialization can be up to 4:1.

Port Descriptions

| Port | Type | Width | Function |
|---------|--------|-------|---|
| CLK | Input | 1 | This high speed clock input drives the serial side of the parallel-to-serial converters. |
| CLKDIV | Input | 1 | This divided high-speed clock input drives the parallel side of the parallel-to-serial converters. This clock is the divided version of the clock connected to the CLK port. |
| D1 - D8 | Input | 1 | All incoming parallel data enters the OSERDES module through ports D1 to D8. These ports are connected to the FPGA fabric, and can be configured from two to eight bits (i.e., a 8:1 serialization). Bit widths greater than six (up to 14) can be supported by using a second OSERDES in SLAVE mode. |
| OCE | Input | 1 | OCE is an active High clock enable for the data path. |
| OFB | Output | 1 | The output feedback port (OFB) is the serial (high-speed) data output port of the OSERDESE2. |

| Port | Type | Width | Function |
|-----------------------|--------|-------|--|
| OQ | Output | 1 | The OQ port is the data output port of the OSERDES module. Data at the input port D1 will appear first at OQ. This port connects the output of the data parallel-to-serial converter to the data input of the IOB. This port can not drive the ODELAYE2; the OFB pin must be used. |
| RST | Input | 1 | The reset input causes the outputs of all data flip-flops in the CLK and CLKDIV domains to be driven Low asynchronously. OSERDES circuits running in the CLK domain where timing is critical use an internal, dedicated circuit to retime the RST input to produce a reset signal synchronous to the CLK domain. Similarly, there is a dedicated circuit to retime the RST input to produce a reset signal synchronous to the CLKDIV domain. Because there are OSERDES circuits that retime the RST input, the user is only required to provide a reset pulse to the RST input that meets timing on the CLKDIV frequency domain (synchronous to CLKDIV). Therefore, RST should be driven High for a minimum of one CLKDIV cycle. When building an interface consisting of multiple OSERDES ports, all OSERDES ports must be synchronized. The internal retiming of the RST input is designed so that all OSERDES blocks that receive the same reset pulse come out of reset synchronized with one another. |
| SHIFTIN1 / SHIFTIN2 | Input | 1 | Cascade Input for data input expansion. Connect to SHIFTOUT1/2 of slave. |
| SHIFTOUT1 / SHIFTOUT2 | Output | 1 | Cascade out for data input expansion. Connect to SHIFTIN1/2 of master. |
| TBYTEIN | Input | 1 | Byte group tristate input from source |
| TBYTEOUT | Output | 1 | Byte group tristate output to IOB |
| TCE | Input | 1 | TCE is an active High clock enable for the 3-state control path. |
| TFB | Output | 1 | This port is the 3-state control output of the OSERDES module sent to the ODELAYE2. When used, this port connects the output of the 3-state parallel-to-serial converter to the control/3-state input of the ODELAYE2. |
| TQ | Output | 1 | This port is the 3-state control output of the OSERDES module. When used, this port connects the output of the 3-state parallel-to-serial converter to the control/3-state input of the IOB. |
| T1 - T4 | Input | 1 | All parallel 3-state signals enter the OSERDES module through ports T1 to T4. The ports are connected to the FPGA fabric, and can be configured as one, two, or four bits. |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|----------------|---------|-----------------------------|----------|---|
| DATA_RATE_OQ | STRING | "DDR", "SDR" | "DDR" | The DATA_RATE_OQ attribute defines whether data is processed as single data rate (SDR) or double data rate (DDR). |
| DATA_RATE_TQ | STRING | "DDR", "BUF", "SDR" | "DDR" | The DATA_RATE_TQ attribute defines whether 3-state control is to be processed as single data rate (SDR) or double data rate (DDR). |
| DATA_WIDTH | DECIMAL | 4, 2, 3, 5, 6, 7, 8, 10, 14 | 4 | The DATA_WIDTH attribute defines the parallel data input width of the parallel-to-serial converter. The possible values for this attribute depend on the DATA_RATE_OQ attribute. When DATA_RATE_OQ is set to SDR, the possible values for the DATA_WIDTH attribute are 2, 3, 4, 5, 6, 7, and 8. When DATA_RATE_OQ is set to DDR, the possible values for the DATA_WIDTH attribute are 4, 6, 8, 10 and 14. When the DATA_WIDTH is set to widths larger than eight, a pair of OSERDES must be configured into a master-slave configuration. |
| INIT_OQ | BINARY | 1'b0 to 1'b1 | 1'b0 | Defines the initial value of OQ output. |
| INIT_TQ | BINARY | 1'b0 to 1'b1 | 1'b0 | Defines the initial value of TQ output. |
| SERDES_MODE | STRING | "MASTER", "SLAVE" | "MASTER" | The SERDES_MODE attribute defines whether the OSERDES module is a master or slave when using width expansion. |
| SRVAL_OQ | BINARY | 1'b0 to 1'b1 | 1'b0 | Defines the value of OQ outputs when the SR is invoked. |
| SRVAL_TQ | BINARY | 1'b0 to 1'b1 | 1'b0 | Defines the value of YQ outputs when the SR is invoked. |
| TBYTE_CTL | STRING | "FALSE", "TRUE" | "FALSE" | Enable Tristate BYTE operation for DDR3 mode. This allows the tristate signal to take value from one of the tristate outputs which is acting as a source. |
| TBYTE_SRC | STRING | "FALSE", "TRUE" | "FALSE" | Enable OSERDES to act as a source for Tristate Byte operation in DDR3 mode. |
| TRISTATE_WIDTH | DECIMAL | 4, 1 | 4 | The TRISTATE_WIDTH attribute defines the parallel 3-state input width of the 3-state control parallel-to-serial converter. The possible values for this attribute depend on the DATA_RATE_TQ attribute. When DATA_RATE_TQ is set to SDR or BUF, the TRISTATE_WIDTH attribute can only be set to 1. When DATA_RATE_TQ is set to DDR, the possible values for the TRISTATE_WIDTH attribute is 4. TRISTATE_WIDTH cannot be set to widths larger than 4. When a |

| Attribute | Type | Allowed Values | Default | Description |
|-----------|------|----------------|---------|--|
| | | | | DATA_WIDTH is larger than four, set the TRISTATE_WIDTH to 1. |

OUT_FIFO

Primitive: Output First-In, First-Out (FIFO) Buffer

The Output FIFO is a new resource located next to the I/O. This dedicated hardware is designed to help transition the data from fabric to the I/O, ODDR or OSERDES. It has two basic modes the first is a 4x4 mode where the data coming into the FIFO goes out at the same rate. The second mode is a 8x4 mode where the data coming out is serialized by a factor of 2. In other words in 8x4 mode 8 bits go to the OUT_FIFO and 4 bits come out.

The Output FIFO is a new resource located next to the I/O. This dedicated hardware is designed to help transition the data from fabric to the I/O, ODDR or OSERDES. It has two basic modes the first is a 4x4 mode where the data coming into the FIFO goes out at the same rate. The second mode is a 8x4 mode where the data coming out is serialized by a factor of 2. In other words in 8x4 mode 8 bits go to the OUT_FIFO and 4 bits come out. Features of this component include:

- Array dimensions: 80 wide, 8 deep (8x4 mode); 40 wide, 8 deep (4x4 mode)
- Empty and Full flags
- Programmable Almost Empty and Almost Full flags

Port Descriptions

| Port | Type | Width | Function |
|-------------|--------|-------|---|
| ALMOSTEMPTY | Output | 1 | Active high output flag indicating the FIFO is almost empty. The threshold of the almost empty flag is set by the ALMOST_EMPTY_VALUE attribute. |
| ALMOSTFULL | Output | 1 | Active high output flag indicating the FIFO is almost full. The threshold of the almost empty flag is set by the ALMOST_FULL_VALUE attribute. |
| D0<7:0> | Input | 8 | Channel 0 input bus. |
| D1<7:0> | Input | 8 | Channel 1 input bus. |
| D2<7:0> | Input | 8 | Channel 2 input bus. |
| D3<7:0> | Input | 8 | Channel 3 input bus. |
| D4<7:0> | Input | 8 | Channel 4 input bus. |
| D5<7:0> | Input | 8 | Channel 5 input bus. |
| D6<7:0> | Input | 8 | Channel 6 input bus. |
| D7<7:0> | Input | 8 | Channel 7 input bus. |
| D8<7:0> | Input | 8 | Channel 8 input bus. |
| D9<7:0> | Input | 8 | Channel 9 input bus. |
| EMPTY | Output | 1 | Active high output flag indicating the FIFO is empty. |
| FULL | Output | 1 | Active high output flag indicating the FIFO is full. |
| Q0<3:0> | Output | 4 | Channel 0 output bus. |
| Q1<3:0> | Output | 4 | Channel 1 output bus. |
| Q2<3:0> | Output | 4 | Channel 2 output bus. |
| Q3<3:0> | Output | 4 | Channel 3 output bus. |
| Q4<3:0> | Output | 4 | Channel 4 output bus. |
| Q5<7:0> | Output | 8 | Channel 5 output bus. |
| Q6<7:0> | Output | 8 | Channel 6 output bus. |
| Q7<3:0> | Output | 4 | Channel 7 output bus. |
| Q8<3:0> | Output | 4 | Channel 8 output bus. |
| Q9<3:0> | Output | 4 | Channel 9 output bus. |
| RDCLK | Input | 1 | Read clock |
| RDEN | Input | 1 | Active high read enable |
| RESET | Input | 1 | Active high asynchronous reset |
| WRCLK | Input | 1 | Write clock |
| WREN | Input | 1 | Active high write enable |

Design Entry Method

PCIE_2_1

Primitive: PCI Express Version 2.1 Model

Introduction

The PCIE_2_1 primitive is a 7 series PCI Express hard macro simulation model compliant with PCIe specification version 2.1. This element is not intended to be instantiated, used, or modified outside of Xilinx generated IP. Please refer to the *7 series FPGAs Integrated Block for PCI Express User Guide* for details on this component.

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | No |
| Inference | No |
| CORE Generator™ and wizards | Recommended |
| Macro support | No |

For More Information

See the [7 series FPGA User Documentation \(User Guides and Data Sheets\)](#).

PCIE_3_0

Primitive: PCI Express Version 3.0 Model

Introduction

The PCIE_3_0 primitive is a 7 series PCI Express hard macro simulation model compliant with PCIe specification version 3.0. This element is not intended to be instantiated, used, or modified outside of Xilinx generated IP. Please refer to the *7 series FPGAs Integrated Block for PCI Express User Guide* for details on this component.

PLLE2_ADV

Primitive: Advanced Phase Locked Loop (PLL)

Introduction

The PLLE2 is a mixed signal block designed to support frequency synthesis, clock network deskew, and jitter reduction. The clock outputs can each have an individual divide (1 to 128), phase shift, and duty cycle based on the same VCO frequency. Output clocks are phase aligned to each other (unless phase shifted) and aligned to the input clock with a proper feedback configuration.

The PLLE2 complements the MMCM by supporting higher speed clocking while the MMCM has more features to handle most general clocking needs. The PLLE2_BASE is intended for most uses of this PLL component while the PLLE2_ADV is intended for use when clock switch-over or dynamic reconfiguration is required.

Port Descriptions

| Port | Type | Width | Function |
|------------|--------|-------|---|
| CLKFBIN | Input | 1 | Feedback clock pin to the PLL |
| CLKFBOUT | Output | 1 | Dedicated PLL Feedback clock output |
| CLKINSEL | Input | 1 | Signal controls the state of the input MUX, High = CLKIN1, Low = CLKIN2. |
| CLKIN1 | Input | 1 | Primary clock input. |
| CLKIN2 | Input | 1 | Secondary clock input. |
| CLKOUT0 | Output | 1 | CLKOUT0 output |
| CLKOUT1 | Output | 1 | Configurable clock output CLKOUT1. |
| CLKOUT2 | Output | 1 | Configurable clock output CLKOUT2. |
| CLKOUT3 | Output | 1 | Configurable clock output CLKOUT3. |
| CLKOUT4 | Output | 1 | Configurable clock output CLKOUT4. |
| CLKOUT5 | Output | 1 | Configurable clock output CLKOUT5. |
| DADDR<6:0> | Input | 7 | The dynamic reconfiguration address (DADDR) input bus provides a reconfiguration address for the dynamic reconfiguration. When not used, all bits must be assigned zeros. |
| DCLK | Input | 1 | The DCLK signal is the reference clock for the dynamic reconfiguration port. |

| Port | Type | Width | Function |
|----------|--------|-------|---|
| DEN | Input | 1 | The dynamic reconfiguration enable (DEN) provides the enable control signal to access the dynamic reconfiguration feature. When the dynamic reconfiguration feature is not used, DEN must be tied Low. |
| DI<15:0> | Input | 16 | The dynamic reconfiguration data input (DI) bus provides reconfiguration data. When not used, all bits must be set to zero. |
| DO<15:0> | Output | 16 | The dynamic reconfiguration output bus provides PLL data output when using dynamic reconfiguration. |
| DRDY | Output | 1 | The dynamic reconfiguration ready output (DRDY) provides the response to the DEN signal for the PLLs dynamic reconfiguration feature. |
| DWE | Input | 1 | The dynamic reconfiguration write enable (DWE) input pin provides the write enable control signal to write the DI data into the DADDR address. When not used, it must be tied Low. |
| LOCKED | Output | 1 | An output from the PLL that indicates when the PLL has achieved phase alignment within a predefined window and frequency matching within a predefined PPM range. The PLL automatically locks after power on, no extra reset is required. LOCKED will be deasserted if the input clock stops or the phase alignment is violated (e.g., input clock phase shift). The PLL automatically reacquires lock after LOCKED is deasserted. |
| PWRDWN | Input | 1 | Powers down instantiated but unused PLLs. |
| RST | Input | 1 | The RST signal is an asynchronous reset for the PLL. The PLL will synchronously re-enable itself when this signal is released and go through a new phase alignment and lock cycle. A reset is required when the input clock conditions change (e.g., frequency). |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|----------------|---------------------------|----------------------------|-------------|---|
| BANDWIDTH | STRING | "OPTIMIZED", "HIGH", "LOW" | "OPTIMIZED" | Specifies the PLLE2 programming algorithm affecting the jitter, phase margin and other characteristics of the PLLE2. |
| CLKFBOUT_MULT | DECIMAL | 2 to 64 | 5 | Specifies the amount to multiply all CLKOUT clock outputs if a different frequency is desired. This number, in combination with the associated CLKOUT#_DIVIDE value and DIVCLK_DIVIDE value, will determine the output frequency. |
| CLKFBOUT_PHASE | 3 significant digit FLOAT | -360.000 to 360.000 | 0.000 | Specifies the phase offset in degrees of the clock feedback output. Shifting the feedback clock results in a negative phase shift of all output clocks to the PLL. |

| Attribute | Type | Allowed Values | Default | Description |
|---|---------------------------|---|---------|--|
| CLKIN1_PERIOD, CLKIN2_PERIOD | FLOAT(ns) | 0.000 to 52.631 | 0.000 | Specifies the input period in ns to the PLLE2 CLKIN inputs. Resolution is down to the ps. For example a value of 33.333 would indicate a 30 MHz input clock. This information is mandatory and must be supplied. CLKIN1_PERIOD relates to the input period on the CLKIN1 input while CLKIN2_PERIOD relates to the input clock period on the CLKIN2 input. |
| CLKOUT0_DIVIDE, CLKOUT1_DIVIDE, CLKOUT2_DIVIDE, CLKOUT3_DIVIDE, CLKOUT4_DIVIDE, CLKOUT5_DIVIDE | DECIMAL | 1 to 128 | 1 | Specifies the amount to divide the associated CLKOUT clock output if a different frequency is desired. This number in combination with the CLKFBOUT_MULT and DIVCLK_DIVIDE values will determine the output frequency. |
| CLKOUT0_DUTY_CYCLE, CLKOUT1_DUTY_CYCLE, CLKOUT2_DUTY_CYCLE, CLKOUT3_DUTY_CYCLE, CLKOUT4_DUTY_CYCLE, CLKOUT5_DUTY_CYCLE | 3 significant digit FLOAT | 0.001 to 0.999 | 0.500 | Specifies the Duty Cycle of the associated CLKOUT clock output in percentage (i.e., 0.500 will generate a 50% duty cycle). |
| CLKOUT0_PHASE, CLKOUT1_PHASE, CLKOUT2_PHASE, CLKOUT3_PHASE, CLKOUT4_PHASE, CLKOUT5_PHASE | 3 significant digit FLOAT | -360.000 to 360.000 | 0.000 | Specifies the phase offset in degrees of the clock feedback output. Shifting the feedback clock results in a negative phase shift of all output clocks to the PLL. |
| COMPENSATION | STRING | "ZHOLD", "BUF_IN", "EXTERNAL", "INTERNAL" | "ZHOLD" | <p>Clock input compensation. Suggested to be set to "ZHOLD". Defines how the PLL feedback is configured.</p> <ul style="list-style-type: none"> "ZHOLD" - PLL is configured to provide a negative hold time at the I/O registers. "INTERNAL" - PLL is using its own internal feedback path so no delay is being compensated. "EXTERNAL" - a network external to the FPGA is being compensated. "BUF_IN" - the configuration does not match with the other compensation modes and no delay will be compensated. |
| DIVCLK_DIVIDE | DECIMAL | 1 to 56 | 1 | Specifies the division ratio for all output clocks with respect to the input clock. Effectively divides the CLKIN going into the PFD. |

| Attribute | Type | Allowed Values | Default | Description |
|-----------------------------|------------------------------|-----------------|---------|---|
| REF_JITTER1, REF_JITTER2 | 3 significant digit FLOAT | 0.000 to 0.999 | 0.010 | Allows specification of the expected jitter on the CLKIN inputs in order to better optimize PLL performance. A bandwidth setting of OPTIMIZED will attempt to choose the best parameter for input clocking when unknown. If known, then the value provided should be specified in terms of the UI percentage (the maximum peak to peak value) of the expected jitter on the input clock. REF_JITTER1 relates to the input jitter on CLKIN1 while REF_JITTER2 relates to the input jitter on CLKIN2. |

PLLE2_BASE

Primitive: Base Phase Locked Loop (PLL)

X10951

Introduction

The PLLE2 is a mixed signal block designed to support frequency synthesis, clock network deskew, and jitter reduction. The clock outputs can each have an individual divide (1 to 128), phase shift, and duty cycle based on the same VCO frequency. Output clocks are phase aligned to each other (unless phase shifted) and aligned to the input clock with a proper feedback configuration.

The PLLE2 complements the MMCM by supporting higher speed clocking while the MMCM has more features to handle most general clocking needs. The PLLE2_BASE is intended for most uses of this PLL component while the PLLE2_ADV is intended for use when clock switch-over or dynamic reconfiguration is required.

Port Descriptions

| Port | Direction | Width | Function |
|----------|-----------|-------|---|
| CLKFBIN | Input | 1 | Feedback clock pin to the PLL |
| CLKFBOUT | Output | 1 | Dedicated PLL Feedback clock output |
| CLKIN1 | Input | 1 | General clock input. |
| CLKOUT0 | Output | 1 | Configurable clock output CLKOUT0. |
| CLKOUT1 | Output | 1 | Configurable clock output CLKOUT1. |
| CLKOUT2 | Output | 1 | Configurable clock output CLKOUT2. |
| CLKOUT3 | Output | 1 | Configurable clock output CLKOUT3. |
| CLKOUT4 | Output | 1 | Configurable clock output CLKOUT4. |
| CLKOUT5 | Output | 1 | Configurable clock output CLKOUT5. |
| LOCKED | Output | 1 | An output from the PLL that indicates when the PLL has achieved phase alignment within a predefined window and frequency matching within a predefined PPM range. The PLL automatically locks after power on, no extra reset is required. LOCKED will be deasserted if the input clock stops or the phase alignment is violated (e.g., input clock |

| Port | Direction | Width | Function |
|--------|-----------|-------|--|
| | | | phase shift). The PLL automatically reacquires lock after LOCKED is deasserted. |
| PWRDWN | Input | 1 | Powers down instantiated but unused PLLs. |
| RST | Input | 1 | The RST signal is an asynchronous reset for the PLL. The PLL will synchronously re-enable itself when this signal is released and go through a new phase alignment and lock cycle. A reset is required when the input clock conditions change (e.g., frequency). |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Yes |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|---|------------------------------|----------------------------------|-------------|---|
| BANDWIDTH | STRING | "OPTIMIZED", "HIGH", "LOW" | "OPTIMIZED" | Specifies the PLLE2 programming algorithm affecting the jitter, phase margin and other characteristics of the PLLE2. |
| CLKFBOUT_MULT | DECIMAL | 2 to 64 | 5 | Specifies the amount to multiply all CLKOUT clock outputs if a different frequency is desired. This number, in combination with the associated CLKOUT#_DIVIDE value and DIVCLK_DIVIDE value, will determine the output frequency. |
| CLKFBOUT_PHASE | 3 significant digit FLOAT | -360.000 to 360.000 | 0.000 | Specifies the phase offset in degrees of the clock feedback output. Shifting the feedback clock results in a negative phase shift of all output clocks to the PLL. |
| CLKIN1_PERIOD | FLOAT(ns) | 0.000 to 52.631 | 0.000 | Specifies the input period in ns to the PLL CLKIN1 input. Resolution is down to the ps (3 decimal places). For example a value of 33.333 would indicate a 30 MHz input clock. This information is mandatory and must be supplied. |
| CLKOUT0_DIVIDE, CLKOUT1_DIVIDE, CLKOUT2_DIVIDE, CLKOUT3_DIVIDE, CLKOUT4_DIVIDE, CLKOUT5_DIVIDE | DECIMAL | 1 to 128 | 1 | Specifies the amount to divide the associated CLKOUT clock output if a different frequency is desired. This number in combination with the CLKFBOUT_MULT and DIVCLK_DIVIDE values will determine the output frequency. |

| Attribute | Type | Allowed Values | Default | Description |
|---|------------------------------|---------------------|---------|--|
| CLKOUT0_DUTY_CYCLE, CLKOUT1_DUTY_CYCLE, CLKOUT2_DUTY_CYCLE, CLKOUT3_DUTY_CYCLE, CLKOUT4_DUTY_CYCLE, CLKOUT5_DUTY_CYCLE | 3 significant digit FLOAT | 0.001 to 0.999 | 0.500 | Specifies the Duty Cycle of the associated CLKOUT clock output in percentage (i.e., 0.500 will generate a 50% duty cycle). |
| CLKOUT0_PHASE, CLKOUT1_PHASE, CLKOUT2_PHASE, CLKOUT3_PHASE, CLKOUT4_PHASE, CLKOUT5_PHASE | 3 significant digit FLOAT | -360.000 to 360.000 | 0.000 | Specifies the phase offset in degrees of the clock feedback output. Shifting the feedback clock results in a negative phase shift of all output clocks to the PLL. |
| DIVCLK_DIVIDE | DECIMAL | 1 to 56 | 1 | Specifies the division ratio for all output clocks with respect to the input clock. Effectively divides the CLKIN going into the PFD. |
| REF_JITTER1 | 3 significant digit FLOAT | 0.000 to 0.999 | 0.010 | Allows specification of the expected jitter on CLKIN1 in order to better optimize PLL performance. A bandwidth setting of OPTIMIZED will attempt to choose the best parameter for input clocking when unknown. If known, then the value provided should be specified in terms of the UI percentage (the maximum peak to peak value) of the expected jitter on the input clock. |
| STARTUP_WAIT | STRING | "FALSE", "TRUE" | "FALSE" | When "TRUE", wait for the PLLE2(s) that have this attribute attached to them will delay DONE from going high until a LOCK is achieved. |

PULLDOWN

Primitive: Resistor to GND for Input Pads, Open-Drain, and 3-State Outputs

PULLDOWN

X10690

Introduction

This resistor element is connected to input, output, or bidirectional pads to guarantee a logic Low level for nodes that might float.

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| O | Output | 1 | Pulldown output (connect directly to top level port) |

Design Entry Method

| | |
|-----------------------------|-----|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

RAM128X1D

Primitive: 128-Deep by 1-Wide Dual Port Random Access Memory (Select RAM)

Introduction

This design element is a 128-bit deep by 1-bit wide random access memory and has a read/write port that writes the value on the D input data pin when the write enable (WE) is high to the memory cell specified by the A address bus. This happens shortly after the rising edge of the WCLK and that same value is reflected in the data output SPO. When WE is low, an asynchronous read is initiated in which the contents of the memory cell specified by the A address bus is output asynchronously to the SPO output. The read port can perform asynchronous read access of the memory by changing the value of the address bus DPRA, and by outputting that value to the DPO data output.

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| SPO | Output | 1 | Read/Write port data output addressed by A |
| DPO | Output | 1 | Read port data output addressed by DPRA |
| D | Input | 1 | Write data input addressed by A |
| A | Input | 7 | Read/Write port address bus |
| DPRA | Input | 7 | Read port address bus |
| WE | Input | 1 | Write Enable |
| WCLK | Input | 1 | Write clock (reads are asynchronous) |

If instantiated, the following connections should be made to this component:

- Tie the WCLK input to the desired clock source, the D input to the data source to be stored and the DPO output to an FDCE D input or other appropriate data destination.
- Optionally, the SPO output can also be connected to the appropriate data destination or else left unconnected.
- Connect the WE clock enable pin to the proper write enable source in the design.
- Connect the 7-bit A bus to the source for the read/write addressing and the 7-bit DPRA bus to the appropriate read address connections.

You can use the INIT attribute to specify the initial contents of the RAM. If left unspecified, the initial contents default to all zeros.

Design Entry Method

RAM128X1S

Primitive: 128-Deep by 1-Wide Random Access Memory (Select RAM)

Introduction

This design element is a 128-bit deep by 1-bit wide random access memory with synchronous write and asynchronous read capability. This RAM is implemented using the LUT resources of the device (also known as Select RAM), and does not consume any of the block RAM resources of the device. If a synchronous read capability is preferred, a register can be attached to the output and placed in the same slice as long as the same clock is used for both the RAM and the register. The RAM128X1S has an active-High write enable, WE, so that when that signal is High, and a rising edge occurs on the WCLK pin, a write is performed recording the value of the D input data pin into the memory array. The output O displays the contents of the memory cell addressed by A, regardless of the WE value. When a write is performed, the output is updated to the new value shortly after the write completes.

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| O | Output | 1 | Read/Write port data output addressed by A |
| D | Input | 1 | Write data input addressed by A |
| A | Input | 7 | Read/Write port address bus |
| WE | Input | 1 | Write Enable |
| WCLK | Input | 1 | Write clock (reads are asynchronous) |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

If instantiated, the following connections should be made to this component:

- Tie the WCLK input to the desired clock source, the D input to the data source to be stored, and the O output to an FDCE D input or other appropriate data destination.
- Connect the WE clock enable pin to the proper write enable source in the design.
- Connect the 7-bit A bus to the source for the read/write.

You can use the INIT attribute to specify the initial contents of the RAM. If left unspecified, the initial contents default to all zeros.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|-------------------|-----------|--|
| INIT | Hexadecimal | Any 128-bit value | All zeros | Specifies the initial contents of the RAM. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

RAM256X1S

Primitive: 256-Deep by 1-Wide Random Access Memory (Select RAM)

Introduction

This design element is a 256-bit deep by 1-bit wide random access memory with synchronous write and asynchronous read capability. This RAM is implemented using the LUT resources of the device (also known as Select RAM), and does not consume any of the block RAM resources of the device. If a synchronous read capability is preferred, a register can be attached to the output and placed in the same slice as long as the same clock is used for both the RAM and the register. The RAM256X1S has an active-High write enable, WE, so that when that signal is High, and a rising edge occurs on the WCLK pin, a write is performed recording the value of the D input data pin into the memory array. The output O displays the contents of the memory cell addressed by A, regardless of the WE value. When a write is performed, the output is updated to the new value shortly after the write completes.

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| O | Output | 1 | Read/Write port data output addressed by A |
| D | Input | 1 | Write data input addressed by A |
| A | Input | 8 | Read/Write port address bus |
| WE | Input | 1 | Write Enable |
| WCLK | Input | 1 | Write clock (reads are asynchronous) |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

If instantiated, the following connections should be made to this component:

- Tie the WCLK input to the desired clock source, the D input to the data source to be stored, and the O output to an FDCE D input or other appropriate data destination.
- Connect the WE clock enable pin to the proper write enable source in the design.
- Connect the 8-bit A bus to the source for the read/write.

You can use the INIT attribute to specify the initial contents of the RAM. If left unspecified, the initial contents default to all zeros.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|-------------------|-----------|--|
| INIT | Hexadecimal | Any 256-bit value | All zeros | Specifies the initial contents of the RAM. |

RAM32M

Primitive: 32-Deep by 8-bit Wide Multi Port Random Access Memory (Select RAM)

Introduction

This design element is a 32-bit deep by 8-bit wide, multi-port, random access memory with synchronous write and asynchronous independent, 2-bit, wide-read capability. This RAM is implemented using the LUT resources of the device known as SelectRAM™, and does not consume any of the Block RAM resources of the device. The RAM32M is implemented in a single slice and consists of one 8-bit write, 2-bit read port and three separate 2-bit read ports from the same memory, which allows for byte-wide write and independent 2-bit read access RAM.

- If the DIA, DIB, DIC, and DID inputs are all tied to the same data inputs, the RAM can become a 1 read/write port, 3 independent read port, 32x2 quad port memory.
- If DID is grounded, DOD is not used.
- If ADDRA, ADDR B, and ADDR C are tied to the same address, the RAM becomes a 32x6 simple dual port RAM.
- If ADDR D is tied to ADDRA, ADDR B, and ADDR C, then the RAM is a 32x8 single port RAM.

There are several other possible configurations for this RAM.

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| DOA | Output | 2 | Read port data outputs addressed by ADDRA |
| DOB | Output | 2 | Read port data outputs addressed by ADDR B |
| DOC | Output | 2 | Read port data outputs addressed by ADDR C |
| DOD | Output | 2 | Read/Write port data outputs addressed by ADDR D |
| DIA | Input | 2 | Write data inputs addressed by ADDR D (read output is addressed by ADDRA) |
| DIB | Input | 2 | Write data inputs addressed by ADDR D (read output is addressed by ADDR B) |
| DIC | Input | 2 | Write data inputs addressed by ADDR D (read output is addressed by ADDR C) |

| Port | Direction | Width | Function |
|--------|-----------|-------|---|
| DID | Input | 2 | Write data inputs addressed by ADDRDR |
| ADDRA | Input | 5 | Read address bus A |
| ADDRB | Input | 5 | Read address bus B |
| ADDRC | Input | 5 | Read address bus C |
| ADDRDR | Input | 5 | 8-bit data write port, 2-bit data read port address bus D |
| WE | Input | 1 | Write Enable |
| WCLK | Input | 1 | Write clock (reads are asynchronous) |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

This element can be inferred by some synthesis tools by describing a RAM with a synchronous write and asynchronous read capability. Consult your synthesis tool documentation for details on RAM inference capabilities and coding examples. You should instantiate this component if you have a need to implicitly specify the RAM function, or if you need to manually place or relationally place the component. If a synchronous read capability is desired, the outputs can be connected to an FDRSE (FDCPE if asynchronous reset is needed) in order to improve the output timing of the function. However, this is not necessary for the proper operation of the RAM. If you want to have the data clocked on the negative edge of a clock, an inverter can be described on the clock input to this component. This inverter will be absorbed into the block giving the ability to write to the RAM on falling clock edges.

If instantiated, the following connections should be made to this component:

- Connect the WCLK input to the desired clock source
- Connect the DIA, DIB, DIC, and DID inputs to the data source to be stored
- Connect the DOA, DOB, DOC, and DOD outputs to an FDCE D input or other appropriate data destination, or leave unconnected if not used
- Connect the WE clock enable pin to the proper write enable source in the design
- Connect the ADDRDR bus to the source for the read/write addressing
- Connect the ADDRA, ADDRBR, and ADDRRC buses to the appropriate read address connections

The optional INIT_A, INIT_B, INIT_C and INIT_D attributes let you specify the initial memory contents of each port using a 64-bit hexadecimal value. The INIT value correlates to the RAM addressing by the following equation: $ADDRy[z] = INIT_y[2*z+1:2*z]$. For instance, if the RAM ADDRDR port is addressed to 00001, then the INIT_C[3:2] values would be the initial values shown on the DOC port before the first write occurs at that address. If left unspecified, the initial contents will be all zeros.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|------------------|-----------|--|
| INIT_A | Hexadecimal | Any 64-bit value | All zeros | Specifies the initial contents of the RAM on port A. |
| INIT_B | Hexadecimal | Any 64-bit value | All zeros | Specifies the initial contents of the RAM on port B. |
| INIT_C | Hexadecimal | Any 64-bit value | All zeros | Specifies the initial contents of the RAM on port C. |
| INIT_D | Hexadecimal | Any 64-bit value | All zeros | Specifies the initial contents of the RAM on port D. |

RAM32X1D

Primitive: 32-Deep by 1-Wide Static Dual Port Synchronous RAM

Introduction

This design element is a 32-bit deep by 1-bit wide static dual port random access memory with synchronous write capability. The device has two separate address ports: the read address (DPRA4:DPRA0) and the write address (A4:A0). These two address ports are completely asynchronous. The read address controls the location of the data driven out of the output pin (DPO), and the write address controls the destination of a valid write transaction. When the write enable (WE) is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When WE is High, any positive transition on WCLK loads the data on the data input (D) into the memory cell selected by the 5-bit write address. For predictable performance, write address and data inputs must be stable before a Low-to-High WCLK transition. This RAM block assumes an active-High WCLK. WCLK can be active-High or active-Low. Any inverter placed on the WCLK input net is absorbed into the block. You can initialize RAM32X1D during configuration using the INIT attribute. Mode selection is shown in the following logic table.

The SPO output reflects the data in the memory cell addressed by A4:A0. The DPO output reflects the data in the memory cell addressed by DPRA4:DPRA0. The write process is not affected by the address on the read address port.

You can use the INIT attribute to specify the initial contents of the RAM. If left unspecified, the initial contents default to all zeros.

Logic Table

| Inputs | | | Outputs | |
|-----------|------|---|---------|--------|
| WE (Mode) | WCLK | D | SPO | DPO |
| 0 (read) | X | X | data_a | data_d |
| 1 (read) | 0 | X | data_a | data_d |
| 1 (read) | 1 | X | data_a | data_d |
| 1 (write) | ↑ | D | D | data_d |
| 1 (read) | ↓ | X | data_a | data_d |

RAM32X1S

Primitive: 32-Deep by 1-Wide Static Synchronous RAM

Introduction

This design element is a 32-bit deep by 1-bit wide static random access memory with synchronous write capability. When the write enable is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When (WE) is High, any positive transition on (WCLK) loads the data on the data input (D) into the memory cell selected by the 5-bit address (A4-A0). For predictable performance, address and data inputs must be stable before a Low-to-High (WCLK) transition. This RAM block assumes an active-High (WCLK). However, (WCLK) can be active-High or active-Low. Any inverter placed on the (WCLK) input net is absorbed into the block.

The signal output on the data output pin (O) is the data that is stored in the RAM at the location defined by the values on the address pins.

You can use the INIT attribute to specify the initial contents of the RAM. If left unspecified, the initial contents default to all zeros.

Logic Table

| Inputs | | | Outputs |
|-----------|------|---|---------|
| WE (Mode) | WCLK | D | O |
| 0 (read) | X | X | Data |
| 1 (read) | 0 | X | Data |
| 1 (read) | 1 | X | Data |
| 1 (write) | ↑ | D | D |
| 1 (read) | ↓ | X | Data |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Descriptions |
|-----------|-------------|------------------|-----------|--|
| INIT | Hexadecimal | Any 32-bit value | All zeros | Specifies initial contents of the RAM. |

RAM32X2S

Primitive: 32-Deep by 2-Wide Static Synchronous RAM

Introduction

This design element is a 32-bit deep by 2-bit wide static random access memory with synchronous write capability. When the write enable (WE) is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When (WE) is High, any positive transition on (WCLK) loads the data on the data input (D1-D0) into the word selected by the 5-bit address (A4-A0). For predictable performance, address and data inputs must be stable before a Low-to-High (WCLK) transition. This RAM block assumes an active-High (WCLK). However, (WCLK) can be active-High or active-Low. Any inverter placed on the (WCLK) input net is absorbed into the block. The signal output on the data output pins (O1-O0) is the data that is stored in the RAM at the location defined by the values on the address pins.

You can use the INIT_00 and INIT_01 properties to specify the initial contents of RAM32X2S.

Logic Table

| Inputs | | | Outputs |
|-----------|------|-------|---------|
| WE (Mode) | WCLK | D | O0-O1 |
| 0 (read) | X | X | Data |
| 1 (read) | 0 | X | Data |

RAM64M

Primitive: 64-Deep by 4-bit Wide Multi Port Random Access Memory (Select RAM)

Introduction

This design element is a 64-bit deep by 4-bit wide, multi-port, random access memory with synchronous write and asynchronous independent bit wide read capability. This RAM is implemented using the LUT resources of the device (also known as SelectRAM™) and does not consume any of the block RAM resources of the device. The RAM64M component is implemented in a single slice, and consists of one 4-bit write, 1-bit read port, and three separate 1-bit read ports from the same memory allowing for 4-bit write and independent bit read access RAM.

- If the DIA, DIB, DIC, and DID inputs are all tied to the same data inputs, the RAM can become a 1 read/write port, 3 independent read port 64x1 quad port memory.
- If DID is grounded, DOD is not used.
- If ADDRA, ADDR B, and ADDR C are tied to the same address, the RAM becomes a 64x3 simple dual port RAM.
- If ADDR D is tied to ADDRA, ADDR B, and ADDR C, the RAM is a 64x4 single port RAM.

There are several other possible configurations for this RAM.

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|--|
| DOA | Output | 1 | Read port data outputs addressed by ADDRA |
| DOB | Output | 1 | Read port data outputs addressed by ADDR B |
| DOC | Output | 1 | Read port data outputs addressed by ADDR C |
| DOD | Output | 1 | Read/Write port data outputs addressed by ADDR D |
| DIA | Input | 1 | Write data inputs addressed by ADDR D (read output is addressed by ADDRA) |
| DIB | Input | 1 | Write data inputs addressed by ADDR D (read output is addressed by ADDR B) |

| Port | Direction | Width | Function |
|-------|-----------|-------|---|
| DIC | Input | 1 | Write data inputs addressed by ADDRD (read output is addressed by ADDRRC) |
| DID | Input | 1 | Write data inputs addressed by ADDRD |
| ADDRA | Input | 6 | Read address bus A |
| ADDRB | Input | 6 | Read address bus B |
| ADDRC | Input | 6 | Read address bus C |
| ADDRD | Input | 6 | 4-bit data write port, 1-bit data read port address bus D |
| WE | Input | 1 | Write Enable |
| WCLK | Input | 1 | Write clock (reads are asynchronous) |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

This element can be inferred by some synthesis tools by describing a RAM with a synchronous write and asynchronous read capability. Consult your synthesis tool documentation for details on RAM inference capabilities and coding examples. Xilinx suggests that you instantiate this component if you have a need to implicitly specify the RAM function, or if you need to manually place or relationally place the component. If a synchronous read capability is desired, the outputs can be connected to an FDRE (FDCE if asynchronous reset is needed) in order to improve the output timing of the function. However, this is not necessary for the proper operation of the RAM. If you want to have the data clocked on the negative edge of a clock, an inverter can be described on the clock input to this component. This inverter will be absorbed into the block giving the ability to write to the RAM on falling clock edges.

If instantiated, the following connections should be made to this component:

- Connect the WCLK input to the desired clock source, the DIA, DIB, DIC
- Connect the DIA, DIB, DIC, and DID inputs to the data source to be stored
- Connect the DOA, DOB, DOC, and DOD outputs to an FDCE D input or other appropriate data destination, or leave unconnected if not used
- Connect the WE clock enable pin to the proper write enable source in the design
- Connect the ADDRD bus to the source for the read/write addressing
- Connect the ADDRA, ADDR B, and ADDR C buses to the appropriate read address connections

The optional INIT_A, INIT_B, INIT_C and INIT_D attributes let you specify the initial memory contents of each port using a 64-bit hexadecimal value. The INIT value correlates to the RAM addressing by the following equation: ADDRy[z] = INIT_y[z]. For instance, if the RAM ADDR C port is addressed to 00001, then the INIT_C[1] values would be the initial values shown on the DOC port before the first write occurs at that address. If left unspecified, the initial contents will default to all zeros.

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|------------------|----------|--|
| INIT_A | Hexadecimal | Any 64-bit value | All zero | Specifies the initial contents of the RAM on port A. |
| INIT_B | Hexadecimal | Any 64-bit value | All zero | Specifies the initial contents of the RAM on port B. |
| INIT_C | Hexadecimal | Any 64-bit value | All zero | Specifies the initial contents of the RAM on port C. |
| INIT_D | Hexadecimal | Any 64-bit value | All zero | Specifies the initial contents of the RAM on port D. |

RAM64X1D

Primitive: 64-Deep by 1-Wide Dual Port Static Synchronous RAM

Introduction

This design element is a 64-bit deep by 1-bit wide static dual port random access memory with synchronous write capability. The device has two separate address ports: the read address (DPRA5:DPRA0) and the write address (A5:A0). These two address ports are completely asynchronous. The read address controls the location of the data driven out of the output pin (DPO), and the write address controls the destination of a valid write transaction. When the write enable (WE) is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected.

When WE is High, any positive transition on WCLK loads the data on the data input (D) into the memory cell selected by the 6-bit (A0:A5) write address. For predictable performance, write address and data inputs must be stable before a Low-to-High WCLK transition. This RAM block assumes an active-High WCLK. WCLK can be active-High or active-Low. Any inverter placed on the WCLK input net is absorbed into the block.

The SPO output reflects the data in the memory cell addressed by A5:A0. The DPO output reflects the data in the memory cell addressed by DPRA5:DPRA0. The write process is not affected by the address on the read address port.

You can use the INIT attribute to specify the initial contents of the RAM. If left unspecified, the initial contents default to all zeros.

Logic Table

| Inputs | | | Outputs | |
|-----------|------|---|---------|--------|
| WE (mode) | WCLK | D | SPO | DPO |
| 0 (read) | X | X | data_a | data_d |
| 1 (read) | 0 | X | data_a | data_d |
| 1 (read) | 1 | X | data_a | data_d |
| 1 (write) | ↑ | D | D | data_d |
| 1 (read) | ↓ | X | data_a | data_d |

data_a = memory cell addressed by bits A5:A0
 data_d = memory cell addressed by bits DPRA5:DPRA0

RAM64X1S

Primitive: 64-Deep by 1-Wide Static Synchronous RAM

Introduction

This design element is a 64-bit deep by 1-bit wide static random access memory (RAM) with synchronous write capability. When the write enable is set Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When WE is set High, any positive transition on WCLK loads the data on the data input (D) into the memory cell selected by the 6-bit address (A5:A0). This RAM block assumes an active-High WCLK. However, WCLK can be active-High or active-Low. Any inverter placed on the WCLK input net is absorbed into the block.

The signal output on the data output pin (O) is the data that is stored in the memory cell defined by the values on the address pins.

You can use the INIT attribute to specify the initial contents of the RAM. If left unspecified, the initial contents default to all zeros.

Logic Table

Mode selection is shown in the following logic table

| Inputs | | | Outputs |
|-----------|------|---|---------|
| WE (mode) | WCLK | D | O |
| 0 (read) | X | X | Data |
| 1 (read) | 0 | X | Data |
| 1 (read) | 1 | X | Data |
| 1 (write) | ↑ | D | D |
| 1 (read) | ↓ | X | Data |

Data = memory cell addressed by bits A5:A0

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|-------------|------------------|-----------|--|
| INIT | Hexadecimal | Any 64-bit value | All zeros | Specifies the initial contents of the RAM. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;
use UNISIM.vcomponents.all;

RAM64X1S_1

Primitive: 64-Deep by 1-Wide Static Synchronous RAM with Negative-Edge Clock

Introduction

This design element is a 64-bit deep by 1-bit wide static random access memory with synchronous write capability. When the write enable is Low, transitions on the write clock (WCLK) are ignored and data stored in the RAM is not affected. When (WE) is High, any negative transition on (WCLK) loads the data on the data input (D) into the memory cell selected by the 6-bit address (A5:A0). For predictable performance, address and data inputs must be stable before a High-to-Low (WCLK) transition. This RAM block assumes an active-Low (WCLK). However, (WCLK) can be active-High or active-Low. Any inverter placed on the (WCLK) input net is absorbed into the block.

The signal output on the data output pin (O) is the data that is stored in the memory cell defined by the values on the address pins.

You can use the INIT attribute to specify the initial contents of the RAM. If left unspecified, the initial contents default to all zeros.

Logic Table

| Inputs | | | Outputs |
|-----------|------|---|---------|
| WE (mode) | WCLK | D | O |
| 0 (read) | X | X | Data |
| 1 (read) | 0 | X | Data |
| 1 (read) | 1 | X | Data |
| 1 (write) | ↓ | D | D |
| 1 (read) | ↑ | X | Data |

Data = memory cell addressed by bits A5:A0

RAMB18E1

Primitive: 18K-bit Configurable Synchronous Block RAM

Introduction

7 series devices contain several block RAM memories that can be configured as FIFOs, automatic error correction RAM, or general-purpose 36Kb or 18Kb RAM/ROM memories. These block RAM memories offer fast and flexible storage of large amounts of on-chip data. The RAMB18E1 allows access to the block RAM in the 18Kb configuration. This element can be configured and used as a 1-bit wide by 16K deep to an 18-bit wide by 1024-bit deep true dual port RAM. This element can also be configured as a 36-bit wide by 512 deep simple dual port RAM. Both read and write operations are fully synchronous to the supplied clock(s) to the component. However, the READ and WRITE ports can operate fully independent and asynchronous to each other, accessing the same memory array. When configured in the wider data width modes, byte-enable write operations are possible, and an optional output register can be used to reduce the clock-to-out times of the RAM.

Port Descriptions

| Port | Type | Width | Function |
|--------------------|-------|-------|---|
| ADDRARDADDR <13:0> | Input | 14 | Port A address input bus/Read address input bus. |
| ADDRBWRADDR <13:0> | Input | 14 | Port B address input bus/Write address input bus. |
| CLKARDCLK | Input | 1 | Rising edge port A clock input/Read clock input. |

| Port | Type | Width | Function |
|---------------|--------|-------|---|
| CLKBWRCLK | Input | 1 | Rising edge port B clock input/Write clock input. |
| DIADI<15:0> | Input | 16 | Port A data input bus/Data input bus addressed by WRADDR. When RAM_MODE="SDP", DIADI is the logical DI<15:0>. |
| DIBDI<15:0> | Input | 16 | Port B data input bus/Data input bus addressed by WRADDR. When RAM_MODE="SDP", DIBDI is the logical DI<31:16>. |
| DIPADIP<1:0> | Input | 2 | Port A parity data input bus/Data parity input bus addressed by WRADDR. When RAM_MODE="SDP", DIPADIP is the logical DIP<1:0>. |
| DIPBDIP<1:0> | Input | 2 | Port B parity data input bus/Data parity input bus addressed by WRADDR. When RAM_MODE="SDP", DIPBDIP is the logical DIP<3:2>. |
| DOADO<15:0> | Output | 16 | Port A data output bus/Data output bus addressed by RDADDR. When RAM_MODE="SDP", DOADO is the logical DO<15:0>. |
| DOBDO<15:0> | Output | 16 | Port B data output bus/Data output bus addressed by RDADDR. When RAM_MODE="SDP", DOBDO is the logical DO<31:16>. |
| DOPADOP<1:0> | Output | 2 | Port A parity data output bus/Data parity output bus addressed by RDADDR. When RAM_MODE="SDP", DOPADOP is the logical DOP<1:0>. |
| DOPBDOP<1:0> | Output | 2 | Port B parity data output bus/Data parity output bus addressed by RDADDR. When RAM_MODE="SDP", DOPBDOP is the logical DOP<3:2>. |
| ENARDEN | Input | 1 | Port A RAM enable/Read enable. |
| ENBWREN | Input | 1 | Port B RAM enable/Write enable. |
| REGCEAREGCE | Input | 1 | Port A output register clock enable input/Output register clock enable input (valid only when DOA_REG=1). |
| REGCEB | Input | 1 | Port B output register clock enable (valid only when DOB_REG=1 and RAM_MODE="TDP"). |
| RSTRAMARSTRAM | Input | 1 | Synchronous data latch set/reset to value indicated by SRVAL_A. RSTRAMARSTRAM sets/resets the BRAM data output latch when DO_REG=0 or 1. If DO_REG=1 there is a cycle of latency between the internal data latch node that is reset by RSTRAMARSTRAM and the DO output of the BRAM. This signal resets port A RAM output when RAM_MODE="TDP" and the entire RAM output when RAM_MODE="SDP". |
| RSTRAMB | Input | 1 | Synchronous data latch set/reset to value indicated by SRVAL_B. RSTRAMB sets/resets the BRAM data output latch when DO_REG=0 or 1. If DO_REG=1 there is a cycle of latency between the internal data latch node that is reset by RSTRAMB and the DO output of the BRAM. Not used when RAM_MODE="SDP". |
| RSTREGARSTREG | Input | 1 | Synchronous output register set/reset to value indicated by SRVAL_A. RSTREGARSTREG sets/resets the output register when DO_REG=1. RSTREG_PRIORITY_A determines if this signal gets priority over REGCEAREGCE. This signal resets port A output when RAM_MODE="TDP" and the entire output port when RAM_MODE="SDP". |
| RSTREGB | Input | 1 | Synchronous output register set/reset to value indicated by SRVAL_B. RSTREGB sets/resets the output register when DO_REG=1. RSTREG_PRIORITY_B determines if this signal gets priority over REGCEB. Not used when RAM_MODE="SDP". |

| Port | Type | Width | Function |
|------------|-------|-------|--|
| WEA<1:0> | Input | 2 | Port A byte-wide write enable. Not used when RAM_MODE="SDP". See User Guide for WEA mapping for different port widths. |
| WEBWE<3:0> | Input | 4 | Port B byte-wide write enable/Write enable. See User Guide for WEBWE mapping for different port widths. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | Yes |
| Macro support | Yes |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|---------------------------|--------|---|-----------------|---|
| RDADDR_COLLISION_HWCONFIG | STRING | "DELAYED_WRITE", "PERFORMANCE" | "DELAYED_WRITE" | When set to "PERFORMANCE" allows for higher clock performance (frequency) in READ_FIRST mode. If using the same clock on both ports of the RAM with "PERFORMANCE" mode, the address overlap collision rules apply where in "DELAYED_WRITE" mode, you can safely use the BRAM without incurring collisions. |
| SIM_COLLISION_CHECK | STRING | "ALL", "GENERATE_X_ONLY", "NONE", "WARNING_ONLY" | "ALL" | <p>Allows modification of the simulation behavior so that if a memory collision occurs</p> <ul style="list-style-type: none"> "ALL" = warning produced and affected outputs/memory go unknown (X) "WARNING_ONLY" = warning produced and affected outputs/memory retain last value "GENERATE_X_ONLY" = no warning and affected outputs/memory go unknown (X) "NONE" = no warning and affected outputs/memory retain last value <p>Note Use this setting carefully. Setting it to a value other than "ALL" can mask design problems during simulation.</p> |

| Attribute | Type | Allowed Values | Default | Description |
|---|---------|--|-------------|---|
| DOA_REG, DOB_REG | DECIMAL | 0, 1 | 0 | A value of 1 enables the output registers to the RAM enabling quicker clock-to-out from the RAM at the expense of an added clock cycle of read latency. A value of 0 allows a read in one clock cycle but will result in slower clock-to-out timing. Applies to port A/B in TDP mode and up to 18 lower bits (including parity bits) in SDP mode. |
| INIT_A, INIT_B | HEX | 18 bit HEX | 18'h00000 | Specifies the initial value on the port output after configuration. Applies to Port A/B in TDP mode and up to 18 lower bits (including parity bits) in SDP mode. |
| INIT_00 to INIT_3F | HEX | 256 bit HEX | All zeros | Allows specification of the initial contents of the 16KB data memory array. |
| INIT_FILE | STRING | String representing file name and location | None | File name of file used to specify initial RAM contents. |
| INITP_00 to INITP_07 | HEX | 256 bit HEX | All zeros | Allows specification of the initial contents of the 2KB parity data memory array. |
| RAM_MODE | STRING | "TDP", "SDP" | "TDP" | Selects simple dual port (SDP) or true dual port (TDP) mode. |
| READ_WIDTH_A | DECIMAL | 0, 1, 2, 4, 9, 18, 36, 72 | 0 | Specifies the desired data width for a read on Port A, including parity bits. This value must be 0 if the Port A is not used. Otherwise, it should be set to the desired port width. In "SDP" mode, this is the read width including parity bits. |
| READ_WIDTH_B | DECIMAL | 0, 1, 2, 4, 9, 18 | 0 | Specifies the desired data width for a read on Port B including parity bits. This value must be 0 if the Port B is not used. Otherwise, it should be set to the desired port width. Not used for "SDP" mode. |
| RSTREG_PRIORITY_A, RSTREG_PRIORITY_B | STRING | "RSTREG", "REGCE" | "RSTREG" | Selects register priority for RSTREG or REGCE. Applies to port A/B in TDP mode and up to 18 lower bits (including parity bits) in SDP mode. |
| SIM_DEVICE | STRING | "7SERIES" | ""7SERIES"" | Must be set to "7SERIES" in order to exhibit proper simulation behavior under all conditions. |
| SRVAL_A, SRVAL_B | HEX | 18 bit HEX | 18'h00000 | Specifies the output value of the RAM upon assertion of the synchronous reset (RSTREG) signal. |

| Attribute | Type | Allowed Values | Default | Description |
|-------------------------------|---------|--|---------------|---|
| WRITE_MODE_A, WRITE_MODE_B | STRING | "WRITE_FIRST", "NO_CHANGE", "READ_FIRST" | "WRITE_FIRST" | <p>Specifies output behavior of the port being written to.</p> <ul style="list-style-type: none"> "WRITE_FIRST" = written value appears on output port of the RAM "READ_FIRST" = previous RAM contents for that memory location appear on the output port "NO_CHANGE" = previous value on the output port remains the same. <p>When RAM_MODE="SDP", WRITE_MODE can not be set to "NO_CHANGE". For simple dual port implementations you should set this attribute to "READ_FIRST" if using the same clock on both ports, or set it to "WRITE_FIRST" if using different clocks. This generally yields an improved collision or address overlap behavior.</p> |
| WRITE_WIDTH_A | DECIMAL | 0, 1, 2, 4, 9, 18 | 0 | Specifies the desired data width for a write to Port A including parity bits. This value must be 0 if the port is not used. Otherwise should be set to the desired write width. Not used in SDP mode. |
| WRITE_WIDTH_B | DECIMAL | 0, 1, 2, 4, 9, 18, 36, 72 | 0 | Specifies the desired data width for a write to Port B including parity bits. This value must be 0 if the port is not used. Otherwise should be set to the desired write width. In SDP mode, this is the write width including parity bits. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```

RAMB36E1

Primitive: 36K-bit Configurable Synchronous Block RAM

Introduction

7 series devices contain a million block RAM memories that can be configured as FIFOs, automatic error correction RAM, or general-purpose 36Kb or 18Kb RAM/ROM memories. These block RAM memories offer fast and flexible storage of large amounts of on-chip data. The RAMB36E1 allows access to the block RAM in the 36Kb configuration. This element can be cascaded to create a larger ram. This element can be configured and used as a 1-bit wide by 32K deep to a 36-bit wide by 1K deep true dual port RAM. This element can also be configured as a 72-bit wide by 512 deep simple dual port RAM. Both read and write operations are fully synchronous to the supplied clock(s) to the component. However, the READ and WRITE ports can operate fully independent and asynchronous to each other, accessing the same memory array. When configured in the wider data width modes, byte-enable write operations are possible, and an optional output register can be used to

reduce the clock-to-out times of the RAM. Error detection and correction circuitry can also be enabled to uncover and rectify possible memory corruptions.

Port Descriptions

| Port | Type | Width | Function |
|--------------------|--------|-------|---|
| ADDRARDADDR <15:0> | Input | 16 | Port A address input bus/Read address input bus. |
| ADDRBWRADDR <15:0> | Input | 16 | Port B address input bus/Write address input bus. |
| CASCADEINA | Input | 1 | Port A cascade input. Never use when RAM_MODE="SDP". |
| CASCADEINB | Input | 1 | Port B cascade input. Never use when RAM_MODE="SDP". |
| CASCADEOUTA | Output | 1 | Port A cascade output. Never use when RAM_MODE="SDP". |
| CASCADEOUTB | Output | 1 | Port B cascade output. Never use when RAM_MODE="SDP". |
| CLKARDCLK | Input | 1 | Rising edge port A clock input/Read clock input. |
| CLKBWRCLK | Input | 1 | Rising edge port B clock input/Write clock input. |
| DBITERR | Output | 1 | Status output from ECC function to indicate a double bit error was detected. EN_ECC_READ needs to be TRUE in order to use this functionality. Not used when RAM_MODE="TDP". |
| DIADI<31:0> | Input | 32 | Port A data input bus/Data input bus addressed by WRADDR. When RAM_MODE="SDP", DIADI is the logical DI<31:0>. |
| DIBDI<31:0> | Input | 32 | Port B data input bus/Data input bus addressed by WRADDR. When RAM_MODE="SDP", DIBDI is the logical DI<63:32>. |
| DIPADIP<3:0> | Input | 4 | Port A parity data input bus/Data parity input bus addressed by WRADDR. When RAM_MODE="SDP", DIPADIP is the logical DIP<3:0>. |
| DIPBDIP<3:0> | Input | 4 | Port B parity data input bus/Data parity input bus addressed by WRADDR. When RAM_MODE="SDP", DIPBDIP is the logical DIP<7:4>. |
| DOADO<31:0> | Output | 32 | Port A data output bus/Data output bus addressed by RDADDR. When RAM_MODE="SDP", DOADO is the logical DO<31:0>. |
| DOBDO<31:0> | Output | 32 | Port B data output bus/Data output bus addressed by RDADDR. When RAM_MODE="SDP", DOBDO is the logical DO<63:32>. |
| DOPADOP<3:0> | Output | 4 | Port A parity data output bus/Data parity output bus addressed by RDADDR. When RAM_MODE="SDP", DOPADOP is the logical DOP<3:0>. |
| DOPBDOP<3:0> | Output | 4 | Port B parity data output bus/Data parity output bus addressed by RDADDR. When RAM_MODE="SDP", DOPBDOP is the logical DOP<7:4>. |
| ECCPARITY<7:0> | Output | 8 | 8-bit data generated by the ECC encoder used by the ECC decoder for memory error detection and correction. Not used if RAM_MODE="TDP". |
| ENARDEN | Input | 1 | Port A RAM enable/Read enable. |
| ENBWREN | Input | 1 | Port B RAM enable/Write enable. |
| INJECTDBITERR | Input | 1 | Inject a double bit error if ECC feature is used. |
| INJECTSBITERR | Input | 1 | Inject a single bit error if ECC feature is used. |
| RDADDRECC<8:0> | Output | 9 | ECC read address. Not used when RAM_MODE="TDP". |
| REGCEAREGCE | Input | 1 | Port A output register clock enable input/Output register clock enable input (valid only when DO_REG=1). |

| Port | Type | Width | Function |
|---------------|--------|-------|---|
| REGCEB | Input | 1 | Port B output register clock enable (valid only when DO_REG=1 and RAM_MODE="TDP"). |
| RSTRAMARSTRAM | Input | 1 | Synchronous data latch set/reset to value indicated by SRVAL_A. RSTRAMARSTRAM sets/resets the BRAM data output latch when DO_REG=0 or 1. If DO_REG=1 there is a cycle of latency between the internal data latch node that is reset by RSTRAMARSTRAM and the DO output of the BRAM. This signal resets port A RAM output when RAM_MODE="TDP" and the entire RAM output when RAM_MODE="SDP". |
| RSTRAMB | Input | 1 | Synchronous data latch set/reset to value indicated by SRVAL_B. RSTRAMB sets/resets the BRAM data output latch when DO_REG=0 or 1. If DO_REG=1 there is a cycle of latency between the internal data latch node that is reset by RSTRAMB and the DO output of the BRAM. Not used when RAM_MODE="SDP". |
| RSTREGARSTREG | Input | 1 | Synchronous output register set/reset to value indicated by SRVAL_A. RSTREGARSTREG sets/resets the output register when DO_REG=1. RSTREG_PRIORITY_A determines if this signal gets priority over REGCEAREGCE. This signal resets port A output when RAM_MODE="TDP" and the entire output port when RAM_MODE="SDP". |
| RSTREGB | Input | 1 | Synchronous output register set/reset to value indicated by SRVAL_B. RSTREGB sets/resets the output register when DO_REG=1. RSTREG_PRIORITY_B determines if this signal gets priority over REGCEB. Not used when RAM_MODE="SDP". |
| SBITERR | Output | 1 | Status output from ECC function to indicate a single bit error was detected. EN_ECC_READ needs to be TRUE in order to use this functionality. Not used when RAM_MODE="TDP". |
| WEA<3:0> | Input | 4 | Port A byte-wide write enable. Not used when RAM_MODE="SDP". See User Guide for WEA mapping for different port widths. |
| WEBWE<7:0> | Input | 8 | Port B byte-wide write enable/Write enable. See User Guide for WEBWE mapping for different port widths. |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | Yes |
| Macro support | Yes |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|---------------------------|--------|--------------------------------|-----------------|--|
| RDADDR_COLLISION_HWCONFIG | STRING | "DELAYED_WRITE", "PERFORMANCE" | "DELAYED_WRITE" | When set to "PERFORMANCE" allows for higher clock performance (frequency) in READ_FIRST mode. If using the same clock on both ports of the RAM with "PERFORMANCE" mode, the address overlap collision rules apply where in "DELAYED_WRITE" mode, you can safely use the BRAM without incurring collisions. |

| Attribute | Type | Allowed Values | Default | Description |
|----------------------|---------|---|--------------|---|
| SIM_COLLISION_CHECK | STRING | "ALL", "GENERATE_X_ONLY", "NONE", "WARNING_ONLY" | "ALL" | <p>Allows modification of the simulation behavior so that if a memory collision occurs</p> <ul style="list-style-type: none"> "ALL" = warning produced and affected outputs/memory go unknown (X) "WARNING_ONLY" = warning produced and affected outputs/memory retain last value "GENERATE_X_ONLY" = no warning and affected outputs/memory go unknown (X) "NONE" = no warning and affected outputs/memory retain last value <p>Note Use this setting carefully. Setting it to a value other than "ALL" can mask design problems during simulation.</p> |
| DOA_REG, DOB_REG | DECIMAL | 0, 1 | 0 | A value of 1 enables the output registers to the RAM, which gives you quicker clock-to-out from the RAM at the expense of an added clock cycle of read latency. A value of 0 allows a read-in-one clock cycle but will result in slower clock-to-out timing. The number of registers activated is the same as the port width and includes parity bits. In SDP mode, DOA_REG and DOB_REG should always be set to the same value. |
| EN_ECC_READ | BOOLEAN | FALSE, TRUE | FALSE | Enable the ECC decoder circuitry. |
| EN_ECC_WRITE | BOOLEAN | FALSE, TRUE | FALSE | Enable the ECC encoder circuitry. |
| INIT_A, INIT_B | HEX | 36 bit HEX | 36'h00000000 | Specifies the initial value on the port output after configuration. In SDP mode, INIT_A and INIT_B should always be set to the same value. |
| INIT_00 to INIT_7F | HEX | 256 bit HEX | All zeros | Allows specification of the initial contents of the 32KB data memory array. |
| INIT_FILE | STRING | String representing file name and location | None | File name of file used to specify initial RAM contents. |
| INITP_00 to INITP_0F | HEX | 256 bit HEX | All zeros | Allows specification of the initial contents of the 4KB parity data memory array. |

| Attribute | Type | Allowed Values | Default | Description |
|---|---------|--|---------------|--|
| RAM_EXTENSION_A, RAM_EXTENSION_B | STRING | "NONE", "LOWER", "UPPER" | "NONE" | Selects cascade mode. If not cascading two BlockRAMs to form a 64K x 1 RAM set to "NONE". If cascading RAMs, set to either "UPPER" or "LOWER" to indicate relative RAM location for proper configuration of the RAM. Not used if RAM_MODE="SDP". |
| RAM_MODE | STRING | "TDP", "SDP" | "TDP" | Selects simple dual port (SDP) or true dual port (TDP) mode. |
| READ_WIDTH_A, READ_WIDTH_B, WRITE_WIDTH_A, WRITE_WIDTH_B | DECIMAL | 0, 1, 2, 4, 9, 18, 36, 72 | 0 | Specifies the desired data width for a read/write on port A/B, including parity bits. This value must be 0 if the port is not used. Otherwise, it should be set to the desired port width. |
| RSTREG_PRIORITY_A, RSTREG_PRIORITY_B | STRING | "RSTREG", "REGCE" | "RSTREG" | Selects register priority for "RSTREG" or "REGCE". In SDP mode, STREG_PRIORITY_A and RSTREG_PRIORITY_B should always be set to the same value. |
| SIM_DEVICE | STRING | "7SERIES" | ""7SERIES"" | Must be set to "7SERIES" in order to exhibit proper simulation behavior under all conditions. |
| SRVAL_A, SRVAL_B | HEX | 36 bit HEX | 36'h00000000 | Specifies the output value of the RAM upon assertion of the synchronous reset (RSTREG) signal. In SDP mode, SRVAL_A and RVAL_B should always be set to the same value. |
| WRITE_MODE_A, WRITE_MODE_B | STRING | "WRITE_FIRST", "NO_CHANGE", "READ_FIRST" | "WRITE_FIRST" | Specifies output behavior of the port being written to. <ul style="list-style-type: none"> "WRITE_FIRST" = written value appears on output port of the RAM "READ_FIRST" = previous RAM contents for that memory location appears on the output port "NO_CHANGE" = previous value on the output port remains the same <p>When RAM_MODE="SDP", WRITE_MODE can not be set to "NO_CHANGE". For simple dual port implementations, it is generally suggested to set WRITE_MODE to "READ_FIRST" if using the same clock on both ports and to set it to "WRITE_FIRST" if using different clocks. This generally yields an improved collision or address overlap behavior when using the BRAM in this configuration.</p> |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```

Library UNISIM;
use UNISIM.vcomponents.all;

ROM128X1

Primitive: 128-Deep by 1-Wide ROM

Introduction

This design element is a 128-word by 1-bit read-only memory. The data output (O) reflects the word selected by the 7-bit address (A6:A0). The ROM is initialized to a known value during configuration with the INIT=value parameter. The value consists of 32 hexadecimal digits that are written into the ROM from the most-significant digit A=FH to the least-significant digit A=0H. An error occurs if the INIT=value is not specified.

Logic Table

| Input | | | | Output |
|-------|----|----|----|----------|
| I0 | I1 | I2 | I3 | O |
| 0 | 0 | 0 | 0 | INIT(0) |
| 0 | 0 | 0 | 1 | INIT(1) |
| 0 | 0 | 1 | 0 | INIT(2) |
| 0 | 0 | 1 | 1 | INIT(3) |
| 0 | 1 | 0 | 0 | INIT(4) |
| 0 | 1 | 0 | 1 | INIT(5) |
| 0 | 1 | 1 | 0 | INIT(6) |
| 0 | 1 | 1 | 1 | INIT(7) |
| 1 | 0 | 0 | 0 | INIT(8) |
| 1 | 0 | 0 | 1 | INIT(9) |
| 1 | 0 | 1 | 0 | INIT(10) |

ROM256X1

Primitive: 256-Deep by 1-Wide ROM

Introduction

This design element is a 256-word by 1-bit read-only memory. The data output (O) reflects the word selected by the 8-bit address (A7:A0). The ROM is initialized to a known value during configuration with the INIT=value parameter. The value consists of 64 hexadecimal digits that are written into the ROM from the most-significant digit A=FH to the least-significant digit A=0H.

An error occurs if the INIT=value is not specified.

Logic Table

| Input | | | | Output |
|-------|----|----|----|----------|

ROM32X1

Primitive: 32-Deep by 1-Wide ROM

Introduction

This design element is a 32-word by 1-bit read-only memory. The data output (O) reflects the word selected by the 5-bit address (A4:A0). The ROM is initialized to a known value during configuration with the INIT=value parameter. The value consists of eight hexadecimal digits that are written into the ROM from the most-significant digit A=1FH to the least-significant digit A=00H.

For example, the INIT=10A78F39 parameter produces the data stream: 0001 0000 1010 0111 1000 1111 0011 1001. An error occurs if the INIT=value is not specified.

Logic Table

| Input | | | | Output |
|-------|----|----|----|----------|
| I0 | I1 | I2 | I3 | O |
| 0 | 0 | 0 | 0 | INIT(0) |
| 0 | 0 | 0 | 1 | INIT(1) |
| 0 | 0 | 1 | 0 | INIT(2) |
| 0 | 0 | 1 | 1 | INIT(3) |
| 0 | 1 | 0 | 0 | INIT(4) |
| 0 | 1 | 0 | 1 | INIT(5) |
| 0 | 1 | 1 | 0 | INIT(6) |
| 0 | 1 | 1 | 1 | INIT(7) |
| 1 | 0 | 0 | 0 | INIT(8) |
| 1 | 0 | 0 | 1 | INIT(9) |
| 1 | 0 | 1 | 0 | INIT(10) |
| 1 | 0 | 1 | 1 | INIT(11) |
| 1 | 1 | 0 | 0 | INIT(12) |
| 1 | 1 | 0 | 1 | INIT(13) |
| 1 | 1 | 1 | 0 | INIT(14) |
| 1 | 1 | 1 | 1 | INIT(15) |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|-----------|-------------|------------------|-----------|------------------------------------|
| INIT | Hexadecimal | Any 32-Bit Value | All zeros | Specifies the contents of the ROM. |

ROM64X1

Primitive: 64-Deep by 1-Wide ROM

Introduction

This design element is a 64-word by 1-bit read-only memory. The data output (O) reflects the word selected by the 6-bit address (A5:A0). The ROM is initialized to a known value during configuration with the INIT=value parameter. The value consists of 16 hexadecimal digits that are written into the ROM from the most-significant digit A=0H to the least-significant digit A=0H. An error occurs if the INIT=value is not specified.

Logic Table

| Input | | | | Output |
|-------|----|----|----|----------|
| I0 | I1 | I2 | I3 | O |
| 0 | 0 | 0 | 0 | INIT(0) |
| 0 | 0 | 0 | 1 | INIT(1) |

SRL16E

Primitive: 16-Bit Shift Register Look-Up Table (LUT) with Clock Enable

Introduction

This design element is a shift register look-up table (LUT). The inputs A3, A2, A1, and A0 select the output length of the shift register.

The shift register can be of a fixed, static length or it can be dynamically adjusted.

- **To create a fixed-length shift register** -Drive the A3 through A0 inputs with static values. The length of the shift register can vary from 1 bit to 16 bits, as determined by the following formula: Length = (8 x A3) + (4 x A2) + (2 x A1) + A0 + 1. If A3, A2, A1, and A0 are all zeros (0000), the shift register is one bit long. If they are all ones (1111), it is 16 bits long.
- **To change the length of the shift register dynamically** -Change the values driving the A3 through A0 inputs. For example, if A2, A1, and A0 are all ones (111) and A3 toggles between a one (1) and a zero (0), the length of the shift register changes from 16 bits to 8 bits. Internally, the length of the shift register is always 16 bits and the input lines A3 through A0 select which of the 16 bits reach the output.

The shift register LUT contents are initialized by assigning a four-digit hexadecimal number to an INIT attribute. The first, or the left-most, hexadecimal digit is the most significant bit. If an INIT value is not specified, it defaults to a value of four zeros (0000) so that the shift register LUT is cleared during configuration.

When CE is High, the data (D) is loaded into the first bit of the shift register during the Low-to-High clock (CLK) transition. During subsequent Low-to-High clock transitions, when CE is High, data shifts to the next highest bit position as new data is loaded. The data appears on the Q output when the shift register length determined by the address inputs is reached. When CE is Low, the register ignores clock transitions.

Logic Table

| Inputs | | | | Output |
|----------------|----|-----|---|-----------------------|
| A _m | CE | CLK | D | Q |
| A _m | 0 | X | X | Q(A _m) |
| A _m | 1 | ↑ | D | Q(A _m - 1) |
| m= 0, 1, 2, 3 | | | | |

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|----------------------------|
| Q | Output | 1 | Shift register data output |
| D | Input | 1 | Shift register data input |
| CLK | Input | 1 | Clock |
| CE | Input | 1 | Active high clock enable |
| A0 | Input | 1 | Select[0] input |
| A1 | Input | 1 | Select[1] input |
| A2 | Input | 1 | Select[2] input |
| A3 | Input | 1 | Select[3] input |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

| Attribute | Data Type | Allowed Values | Default | Description |
|-----------|--------------|------------------|-----------|---|
| INIT | Hexa-decimal | Any 16-Bit Value | All zeros | Sets the initial value of content and output of shift register after configuration. |

SRLC32E

Primitive: 32 Clock Cycle, Variable Length Shift Register Look-Up Table (LUT) with Clock Enable

Introduction

This design element is a variable length, 1 to 32 clock cycle shift register implemented within a single look-up table (LUT). The shift register can be of a fixed length, static length, or it can be dynamically adjusted by changing the address lines to the component. This element also features an active-high clock enable and a cascading feature in which multiple SRLC32Es can be cascaded in order to create greater shift lengths.

Port Descriptions

| Port | Direction | Width | Function |
|------|-----------|-------|---|
| Q | Output | 1 | Shift register data output |
| Q31 | Output | 1 | Shift register cascaded output (connect to the D input of a subsequent SRLC32E) |
| D | Input | 1 | Shift register data input |
| CLK | Input | 1 | Clock |
| CE | Input | 1 | Active high clock enable |
| A | Input | 5 | Dynamic depth selection of the SRL A=00000 => 1-bit shift length A=11111 => 32-bit shift length |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | Recommended |
| CORE Generator™ and wizards | No |
| Macro support | No |

If instantiated, the following connections should be made to this component:

- Connect the CLK input to the desired clock source, the D input to the data source to be shifted/stored and the Q output to either an FDCE or an FDRE input or other appropriate data destination.
- The CE clock enable pin can be connected to a clock enable signal in the design or else tied to a logic one if not used.
- The 5-bit A bus can either be tied to a static value between 0 and 31 to signify a fixed 1 to 32 bit static shift length, or else it can be tied to the appropriate logic to enable a varying shift depth anywhere between 1 and 32 bits.
- If you want to create a longer shift length than 32, connect the Q31 output pin to the D input pin of a subsequent SRLC32E to cascade and create larger shift registers.
- It is not valid to connect the Q31 output to anything other than another SRLC32E.
- The selectable Q output is still available in the cascaded mode, if needed.
- An optional INIT attribute consisting of a 32-bit Hexadecimal value can be specified to indicate the initial shift pattern of the shift register.
- (INIT[0] will be the first value shifted out.)

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|-----------|--------------|------------------|-----------|---|
| INIT | Hexa-decimal | Any 32-Bit Value | All zeros | Specifies the initial shift pattern of the SRLC32E. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
Library UNISIM;

STARTUPE2

Primitive: STARTUP Block

Introduction

This design element is used to interface device pins and logic to the global asynchronous set/reset (GSR) signal, the global 3-state (GTS) dedicated routing or the internal configuration signals or a few of the dedicated configuration pins.

Port Descriptions

| Port | Type | Width | Function |
|-----------|--------|-------|---|
| CFGCLK | Output | 1 | Configuration main clock output |
| CFGMCLK | Output | 1 | Configuration internal oscillator clock output |
| CLK | Input | 1 | User start-up clock input |
| EOS | Output | 1 | Active high output signal indicating the End Of Startup. |
| GSR | Input | 1 | Global Set/Reset input (GSR cannot be used for the port name) |
| GTS | Input | 1 | Global 3-state input (GTS cannot be used for the port name) |
| KEYCLEARB | Input | 1 | Clear AES Decrypter Key input from Battery-Backed RAM (BBRAM) |
| PACK | Input | 1 | PROGRAM acknowledge input |
| PREQ | Output | 1 | PROGRAM request to fabric output |
| USRCCLKO | Input | 1 | User CCLK input |
| USRCCLKTS | Input | 1 | User CCLK 3-state enable input |
| USRDONEO | Input | 1 | User DONE pin output control |
| USRDONETS | Input | 1 | User DONE 3-state enable output |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Recommended |
| Inference | No |
| CORE Generator™ and wizards | No |
| Macro support | No |

Available Attributes

XADC

Primitive: Dual 12-Bit 1MSPS Analog-to-Digital Converter

Introduction

The XADC includes a dual 12-bit, 1 Mega sample per second (MSPS) ADC and on-chip sensors. These ADCs are fully tested and specified (see the respective 7 series FPGAs data sheet). The ADCs provide a general-purpose, high-precision analog interface for a range of applications. The dual ADCs support a range of operating modes, for example, externally triggered and simultaneous sampling on both ADCs and various analog input signal types, for example, unipolar and differential. The ADCs can access up to 17 external analog input channels. The XADC also includes a number of on-chip sensors that support measurement of the on-chip power supply voltages and die temperature. The ADC conversion data is stored in dedicated registers called status registers. These registers are accessible via the FPGA interconnect using a 16-bit synchronous read and write port called the Dynamic Reconfiguration Port (DRP). ADC conversion data is also accessible via the JTAG TAP. In the latter case, users are not required to instantiate the XADC because it is a dedicated interface that uses the existing FPGA JTAG infrastructure. If the XADC is not instantiated in a design, the device operates in a predefined mode (called default mode) that monitors on-chip temperature and supply voltages. XADC operation is user defined by writing to the control registers using either the DRP or JTAG interface. It is also possible to initialize these register contents when the XADC is instantiated in a design using the block attributes.

Port Descriptions

| Port | Type | Width | Function |
|--------------|--------|-------|---|
| ALM<7:0> | Output | 8 | Output alarm for temperature, Vccint, Vccaux and Vccbram. <ul style="list-style-type: none"> ALM[0] - XADC temperature sensor alarm output. ALM[1] - XADC Vccint sensor alarm output. ALM[2] - XADC Vccaux sensor alarm output. ALM[3] - XADC Vccbram sensor alarm output. ALM[6:4] - Not defined. |
| BUSY | Output | 1 | ADC busy signal. This signal transitions High during an ADC conversion. This signal also transitions High for an extended period during an ADC or sensor calibration. |
| CHANNEL<4:0> | Output | 5 | Channel selection outputs. The ADC input MUX channel selection for the current ADC conversion is placed on these outputs at the end of an ADC conversion. |

| Port | Type | Width | Function |
|--------------|--------|-------|--|
| CONVST | Input | 1 | Convert start input. This input controls the sampling instant on the ADC(s) input and is only used in event mode timing. This input comes from the general-purpose interconnect in the FPGA logic. |
| CONVSTCLK | Input | 1 | Convert start clock input. This input is connected to a clock net. Like CONVST, this input controls the sampling instant on the ADC(s) inputs and is only used in event mode timing. This input comes from the local clock distribution network in the FPGA logic. Thus, for the best control over the sampling instant (delay and jitter), a global clock input can be used as the CONVST source. |
| DADDR<6:0> | Input | 7 | Address bus for the dynamic reconfiguration port. |
| DCLK | Input | 1 | Clock input for the dynamic reconfiguration port. |
| DEN | Input | 1 | Enable signal for the dynamic reconfiguration port. |
| DI<15:0> | Input | 16 | Input data bus for the dynamic reconfiguration port. |
| DO<15:0> | Output | 16 | Output data bus for dynamic reconfiguration port. |
| DRDY | Output | 1 | Data ready signal for the dynamic reconfiguration port. |
| DWE | Input | 1 | Write enable for the dynamic reconfiguration port. |
| EOC | Output | 1 | End of Conversion signal. This signal transitions to an active High at the end of an ADC conversion when the measurement is written to the status registers. |
| EOS | Output | 1 | End of Sequence. This signal transitions to active High when the measurement data from the last channel in an automatic channel sequence is written to the status registers. |
| JTAGBUSY | Output | 1 | Used to indicate that a JTAG DRP transaction is in progress. |
| JTAGLOCKED | Output | 1 | Indicates that a DRP port lock request has been made by the JTAG interface. This signal is also used to indicate that the DRP is ready for access (when Low). |
| JTAGMODIFIED | Output | 1 | Used to indicate that a JTAG Write to the DRP has occurred. |
| MUXADDR<4:0> | Output | 5 | These outputs are used in external multiplexer mode. They indicate the address of the next channel in a sequence to be converted. They provide the channel address for an external multiplexer. |
| OT | Output | 1 | Over-Temperature alarm |
| RESET | Input | 1 | Reset signal for the XADC control logic. |
| VAUXN<15:0> | Input | 16 | N-side auxiliary analog input |
| VAUXP<15:0> | Input | 16 | P-side auxiliary analog input |
| VN | Input | 1 | N-side analog input |
| VP | Input | 1 | P-side analog input |

Design Entry Method

| | |
|-----------------------------|-------------|
| Instantiation | Yes |
| Inference | No |
| CORE Generator™ and wizards | Recommended |
| Macro support | No |

Available Attributes

| Attribute | Type | Allowed Values | Default | Description |
|--|--------|--|--------------|---|
| INIT_4A | HEX | 16'h0000 to 16'hffff | 16'h0000 | Sequence register 2 |
| INIT_4B | HEX | 16'h0000 to 16'hffff | 16'h0000 | Sequence register 3 |
| INIT_4C | HEX | 16'h0000 to 16'hffff | 16'h0000 | Sequence register 4 |
| INIT_4D | HEX | 16'h0000 to 16'hffff | 16'h0000 | Sequence register 5 |
| INIT_4E | HEX | 16'h0000 to 16'hffff | 16'h0000 | Sequence register 6 |
| INIT_4F | HEX | 16'h0000 to 16'hffff | 16'h0000 | Sequence register 7 |
| INIT_5C | HEX | 16'h0000 to 16'hffff | 16'h0000 | Vbram lower alarm threshold |
| INIT_40 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Configuration register 0 |
| INIT_41 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Configuration register 1 |
| INIT_42 | HEX | 16'h0000 to 16'hffff | 16'h0800 | Configuration register 2 |
| INIT_43 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Test register 0 |
| INIT_44 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Test register 1 |
| INIT_45 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Test register 2 |
| INIT_46 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Test register 3 |
| INIT_47 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Test register 4 |
| INIT_48 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Sequence register 0 |
| INIT_49 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Sequence register 1 |
| INIT_50 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Alarm limit register 0 |
| INIT_51 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Alarm limit register 1 |
| INIT_52 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Alarm limit register 2 |
| INIT_53 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Alarm limit register 3 |
| INIT_54 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Alarm limit register 4 |
| INIT_55 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Alarm limit register 5 |
| INIT_56 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Alarm limit register 6 |
| INIT_57 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Alarm limit register 7 |
| INIT_58 | HEX | 16'h0000 to 16'hffff | 16'h0000 | Vbram upper alarm threshold |
| INIT_59, INIT_5A, INIT_5B, INIT_5D, INIT_5E, INIT_5F | HEX | 16'h0000 to 16'hffff | 16'h0000 | Reserved for future use |
| SIM_DEVICE | STRING | "7SERIES", "ZYNQ" | "7SERIES" | Selects target device to allow for proper simulation. |
| SIM_MONITOR_FILE | STRING | String representing file name and location | "design.txt" | Specify the file name (and directory if different from simulation directory) of file containing analog voltage and temperature data for XADC simulation behavior. |

VHDL Instantiation Template

Unless they already exist, copy the following two statements and paste them before the entity declaration.

```
